Preface *XIII*
References *XXI*

Notation and Abbreviations *XXIII*

1 Introduction to Predictive Control *1*
1.1 Preview of Predictive Control *2*
1.1.1 Prediction of the Reference Value *3*
1.1.2 Prediction of the Disturbance *3*
1.2 Manipulated, Reference, and Controlled Signals *4*
1.3 Cost Function of Predictive Control *5*
1.4 Reference Signal and Disturbance Preview, Receding Horizon, One-Step-Ahead, and Long-Range Optimal Control *8*
1.5 Free and Forced Responses of the Predicted Controlled Variable *12*
1.6 Minimization of the Cost Function *13*
1.6.1 Minimization Algorithms for Nonlinear Processes with or without Constraints *14*
1.6.2 Minimization of the Quadratic Cost Function for Linear Processes without Constraints *14*
1.7 Simple Tuning Rules of Predictive Control *15*
1.8 Control of Different Linear SISO Processes *18*
1.9 Control of Different Linear MIMO Processes *21*
1.10 Control of Nonlinear Processes *23*
1.11 Control under Constraints *24*
1.12 Robustness *25*
1.13 Summary *27*
References *28*

2 Linear SISO Model Descriptions *29*
2.1 Nonparametric System Description *31*
2.1.1 FIR Model *31*
2.1.2 FSR Model *33*
2.1.3 Relationship between the FIRs and the FSRs *35*
2.1.4 Disturbance Model *36*

2.2 Pulse-Transfer Function Model *36*
2.2.1 Pulse-Transfer Function and Difference Equation *37*
2.2.2 Relationship between the Pulse-Transfer Function, the Weighting Function, and the Step Response Models *38*
2.2.3 Disturbance Model *41*
2.3 Discrete-Time State Space Model *43*
2.3.1 Minimal-Order State Space Representation *44*
2.3.2 Non-Minimal-Order State Space Representations *48*
2.4 Summary *54*
References *54*

3 Predictive Equations of Linear SISO Models *55*
3.1 Predictive Equations Based on Nonparametric Models *56*
3.1.1 Predictive Equations of the Impulse Response Model *56*
3.1.2 Predictive Equations of the Step Response Model *61*
3.2 Predictive Equations Based on the Pulse-Transfer Function *64*
3.2.1 Repeated Substitution of the Process Model Equation *65*
3.2.2 Prediction by Solving the Diophantine Equation *70*
3.2.3 Prediction if the Additive Noise Is Autoregressive *74*
3.2.4 Prediction in the Presence of a Measurable Disturbance *78*
3.2.5 Prediction if the Additive Noise Is Nonautoregressive *81*
3.2.6 Matrix Calculation Method *88*
3.3 Predictive Equations of the State Space Model *93*
3.4 Summary *99*
References *101*

4 Predictive On–Off Control *103*
4.1 Classical On–Off Control by Means of Relay Characteristics *104*
4.2 Predictive Set Point Control *107*
4.2.1 Cost Function Minimization by a Selection Strategy *108*
4.2.2 Cost Function Minimization by a Genetic Algorithm *110*
4.2.3 Simulation and Comparison of the Predictive Set Point Control Algorithms *110*
4.3 Predictive Start-Up Control at a Reference Signal Change *112*
4.4 Predictive Gap Control *118*
4.4.1 Quadratic Cost Function Minimization by the Selection Strategy or the Genetic Algorithm *118*
4.4.2 Quasi Continuous-Time Optimization *119*
4.4.3 Minimizing a Limit-Violation-Time-Point-Dependent Cost Function *121*
4.4.4 Online Start-Up Strategy *124*
4.4.5 Comparison of the Predictive On–Off Gap Control Algorithms *126*
4.5 Case Study: Temperature Control of an Electrical Heat Exchanger *131*

4.6 Summary *133*
References *134*

5 Generalized Predictive Control of Linear SISO Processes *135*
5.1 Control Algorithm without Constraints *135*
5.2 Linear Polynomial Form of Unconstrained GPC *142*
5.3 Tuning the Controller Parameters *151*
5.3.1 Effect of the Controller Parameters on the Control Behavior *151*
5.3.2 Recommended Initial Parameters *161*
5.3.3 Systematic Tuning of the Controller Parameters *163*
5.3.4 Optimization of the Controller Parameters by a Genetic Algorithm *165*
5.3.5 Simple Rule of Thumb for Tuning Second-Order Aperiodic Processes *172*
5.4 Blocking and Coincidence Points Techniques *173*
5.4.1 Coincidence Points Technique *175*
5.4.2 Blocking Technique *176*
5.4.3 Simultaneous Use of Coincidence Points and Blocking Techniques *178*
5.4.4 Some Heuristic Rules on Allocation of the Coincidence Points *179*
5.4.5 Some Blocking Techniques *182*
5.4.6 Optimal Choice of the Coincidence Points and the Blocking Technique *183*
5.5 Measured Disturbance Feed-Forward Compensation *188*
5.6 Control Algorithm with Constraints *193*
5.6.1 Physical Constraints *193*
5.6.2 Mathematical Formulation of Typical Constraints *194*
5.6.3 Hard and Soft Constraints *198*
5.6.4 Explicit MPC with Multiparametric Programming without Online Optimization *200*
5.6.5 Simulation Results *207*
5.7 Extended GPC with Terminal Methods *213*
5.7.1 End-Point State Constraint *213*
5.7.2 End-Point State Weighting *216*
5.8 Summary *218*
References *219*

6 Predictive PID Control Algorithms *221*
6.1 Predictive PI(D) Control Structure *222*
6.2 Predictive PI Control Algorithm *222*
6.2.1 One-Step-Ahead Predictive PI Control *223*
6.2.2 Long-Range Predictive PI Control *224*
6.2.3 Predictive PI Control of a First-Order Process with Dead Time *225*
6.3 Predictive PID Control Algorithm *228*

6.3.1 One-Step-Ahead Predictive PID Control *229*
6.3.2 Long-Range Predictive PID Control *230*
6.3.3 Predictive PID Control of a Second-Order Process with Dead Time *231*
6.4 Equivalence between the Predictive PI(D) Algorithm and the Generalized Predictive Control Algorithm *234*
6.4.1 Equivalence in the Case of Extended Horizon Control *234*
6.4.2 Equivalence in the Case of Long-Range Horizon Control *236*
6.5 Tuning of Predictive PI(D) Algorithms *240*
6.6 Robustifying Effects Applied for Predictive PI(D) Control Algorithms *245*
6.7 Summary *249*
References *249*

7 Predictive Control of Multivariable Processes *251*
7.1 Model Descriptions *252*
7.1.1 Matrix Fraction Model *252*
7.1.2 State Space Representation *255*
7.2 Predictive Equations *260*
7.2.1 Prediction Based on the Matrix Fraction Model *260*
7.2.2 Prediction Based on the State Space Representation *271*
7.3 The Control Algorithm *277*
7.4 Polynomial Form of the Controller (without Matrix Inversion) *284*
7.5 Pairing of the Controlled and the Manipulated Variables *287*
7.6 Scaling of the Controlled and the Manipulated Variables *290*
7.7 Tuning *294*
7.8 Decoupling Control *297*
7.8.1 Decoupling by Using Static Compensators *300*
7.8.2 Decoupling by Using a Dynamic Compensator *308*
7.8.3 Decoupling by Slowing the Reference Signal Change *312*
7.8.4 Decoupling by Changing the Control Error Weighting Factors at Any Set Point Change *315*
7.8.5 Decoupling by Control-Error-Dependent Adaptation of the Control Error Weighting Factors *316*
7.9 Case Study: Control of a Distillation Column *318*
7.9.1 Distillation Column Model *318*
7.9.2 Predictive TITO Control *321*
7.9.3 Decoupling by Using Static Compensators *323*
7.9.4 Decoupling by Control-Error-Dependent Adaptation of the Control Error Weighting Factors *328*
7.9.5 Summary of the Experiences *330*
7.10 Summary *331*
References *332*

8 Estimation of the Predictive Equations *335*
8.1 LS Parameter Estimation *336*
8.2 More-Steps-Ahead Prediction Based on the Estimated Process Model *337*
8.3 Long-Range Optimal Single Process Model Identification *339*
8.4 Multi-Step-Ahead Predictive Equation Identification *344*
8.5 Comparison of the Long-Range Optimal Identification Algorithms *346*
8.6 Case Study: Level Control in a Two-Tank Plant *348*
8.7 Summary *350*
References *350*

9 Multimodel and Multicontroller Approaches *353*
9.1 Nonlinear Process Models *354*
9.1.1 Models with Signal-Dependent and Direction-Dependent Parameters *354*
9.1.2 Multimodels *355*
9.1.3 Multiparameter Models *358*
9.2 Predictive Equations *359*
9.3 The Control Algorithm *359*
9.3.1 Control Based on the Multimodel Approach *359*
9.3.2 Control Based on the Multiparameter Model *360*
9.3.3 Multicontroller Approach *360*
9.4 Case Study *362*
9.4.1 Experimental Modeling of an Electrically Heated Heat Exchanger *362*
9.4.2 Temperature Control of an Electrically Heated Heat Exchanger *370*
9.4.3 Temperature Control with Forced Heating and Free Convective Cooling *375*
9.5 Summary *379*
References *380*

10 GPC of Nonlinear SISO Processes *383*
10.1 Nonlinear Process Models *383*
10.1.1 Nonparametric Process Models *384*
10.1.2 Cascade Process Models *385*
10.1.3 Quadratic Block-Oriented Process Models *386*
10.1.4 Linear-in-Parameters Models Including Multiplicative Terms *388*
10.2 Predictive Equations for the Nonparametric and Parametric Hammerstein and Volterra Models *391*
10.2.1 Predictive Equation Using the Input Signal *392*
10.2.2 Predictive Equation Using the Input Increments *397*
10.2.3 Common Incremental Predictive Form of the Quadratic Models *405*

10.3 Control Based on Nonparametric and Parametric Hammerstein and Volterra Models *406*
10.3.1 One-Dimensional Minimization of the Cost Function *406*
10.3.2 Multidimensional Minimization of the Cost Function *410*
10.3.3 Simulation Results *414*
10.4 Control Based on Linearized Models *422*
10.5 Control Based on Nonlinear Free and Linearized Forced Responses *422*
10.6 Case Study: Level Control of a Two-Tank Plant *424*
10.6.1 Nonlinear Process Model of the Two-Tank Process *424*
10.6.2 Level Control of the Two-Tank Process *426*
10.6.3 Level Control Based on Linearized Models *430*
10.6.4 Level Control Based on Nonlinear Free and Linearized Forced Responses *431*
10.7 Summary *433*
References *434*

11 Predictive Functional Control *437*
11.1 Control Strategy and Controller Parameters for a Constant Set Point *438*
11.2 PFC for Aperiodic Processes *443*
11.2.1 PFC for First-Order Processes without Dead Time *443*
11.2.2 PFC for Higher-Order Aperiodic Processes without Dead Time *446*
11.2.3 PFC for a First-Order Process with Dead Time *449*
11.3 PFC with Disturbance Feed-Forward *451*
11.3.1 Algorithm for First-Order Process and Disturbance Models without Dead Time *451*
11.3.2 Algorithm for First-Order Process and Disturbance Models with Dead Time *452*
11.4 PFC with Constraints *454*
11.5 Nonlinear PFC for Processes with Signal-Dependent Parameters *457*
11.6 Case Study: Temperature Control of a Hot Air Blower *458*
11.6.1 Physical Model of the Pilot Plant *459*
11.6.2 Linear Process and Disturbance Model Identification *459*
11.6.3 Simulation of Linear Temperature Control *460*
11.6.4 Linear Temperature Control with a Real Process System *461*
11.6.5 Nonlinear Process Model Identification *462*
11.6.6 Nonlinear Temperature Control with a Real Process System *463*
11.7 Summary *464*
References *465*

12 Case Studies *467*
12.1 Predictive Temperature Control of an Injection Molding Machine *468*
12.1.1 Modeling of the Plastification Unit *469*

12.1.2 Predictive Zone Temperature Control *473*
12.1.3 Predictive Start-Up Control with Temperature Difference Limitation *475*
12.1.4 Summary *477*
12.2 Wastewater Quality Control of an Intermittently Operated Plant *477*
12.2.1 Modeling of the Plant *479*
12.2.2 Conventional On–Off Control *480*
12.2.3 Predictive On–Off Control Based on the Simulated Physical Model *481*
12.2.4 Predictive On–Off Control Based on a Simplified Model *482*
12.2.5 Summary *487*
12.3 Wastewater Quality Control with Pre-denitrification *488*
12.3.1 Modeling of the Plant *489*
12.3.2 Comparison of the Conventional and Predictive Three-Level Control *489*
12.3.3 Summary *492*
References *494*

13 Industrial Applications *497*
13.1 Concentration Control and Pressure Minimization of a Petrochemical Distillation Column *498*
13.1.1 Description of the Distillation Column *499*
13.1.2 Control Targets, Controlled and Manipulated Signals, Constraints *500*
13.1.3 The Process Model *504*
13.1.4 Choice of the Set Values, Constraints, and Weighting Factors *506*
13.1.5 Simulation Results of the Tuning of the Weighting Factors *508*
13.1.6 Implementation and Results of Real-Time Control *511*
13.1.7 Economic Benefits of the Optimization *513*
13.1.8 Summary *514*
13.2 Concentration Control and Reducing Steam Consumption in a Stripping Column *515*
13.2.1 Description of the Stripping Column and the Basic Control Loops *515*
13.2.2 Control Targets, Controlled and Manipulated Signals, Constraints *516*
13.2.3 Process Models from Step Tests *519*
13.2.4 Hierarchical Minimization of the Control Cost Function *520*
13.2.5 Set Point Control Considering the Constraints *522*
13.2.6 The Controller Parameters *523*
13.2.7 Real-Time Control *523*
13.2.8 Economic Benefits and Summary *525*

13.3 Temperature and Combustion Control of a Gas-Heated Furnace for Chemical Gasoline *527*
13.3.1 The Furnace with the Reactor and Control Targets *528*
13.3.2 Manipulated, Controlled, and Disturbance Signals *529*
13.3.3 Process Model *530*
13.3.4 Predictive Control Algorithm and the Choice of the Set Values, Constraints, and Weighting Factors *534*
13.3.5 Simulation of Set Value, Disturbance Changes, and Constraint Violation *539*
13.3.6 The Effect of the Weighting Factors of the Controlled, Manipulated, and Constrained Signals *544*
13.3.7 Real-Time Predictive Control *549*
13.3.8 Summary *551*
References *552*

14 Practical Aspects and Future Trends *553*
14.1 Classification of a Predictive Control Project *553*
14.2 Project Implementation *559*
14.2.1 APC Project Chain *561*
14.2.2 Achievable Benefits, an Example *565*
14.3 Implementation of a Predictive Controller *566*
14.3.1 Control Aim and Optimization *566*
14.3.2 Advanced Optimization Features *569*
14.3.3 Signal Scaling and Weighting *572*
14.3.4 Handling of Ill Conditions *574*
14.3.5 Handling of Constraints *575*
14.3.6 Handling of Set Point or Set Range Changes *578*
14.3.7 Techniques to Reduce Computational Effort *580*
14.3.8 Dealing with Inner Loop Performance *581*
14.4 Future Trends *585*
14.4.1 Identification and Testing of the Plant *585*
14.4.2 Nonlinear MPC *591*
14.4.3 Integration of a Predictive Controller into the Base Layer *592*
14.4.4 Performance Monitoring *593*
14.5 Summary *594*
References *595*
