

## Contents

**Preface** *XXI*

### **1 Introduction** *1*

- 1.1 Philosophy of this Book *1*
- 1.2 Short Reader's Guide *4*
- 1.3 Notational Conventions and Choice of Units *6*

### **Part I — Fundamentals**

**9**

### **2 Elements of Classical Mechanics and Electrodynamics** *11*

- 2.1 Elementary Newtonian Mechanics *11*
  - 2.1.1 Newton's Laws of Motion *11*
  - 2.1.2 Galilean Transformations *14*
    - 2.1.2.1 Relativity Principle of Galilei *14*
    - 2.1.2.2 General Galilean Transformations and Boosts *16*
    - 2.1.2.3 Galilei Covariance of Newton's Laws *17*
    - 2.1.2.4 Scalars, Vectors, Tensors in 3-Dimensional Space *17*
  - 2.1.3 Conservation Laws for One Particle in Three Dimensions *20*
  - 2.1.4 Collection of  $N$  Particles *21*
- 2.2 Lagrangian Formulation *22*
  - 2.2.1 Generalized Coordinates and Constraints *22*
  - 2.2.2 Hamiltonian Principle and Euler–Lagrange Equations *24*
    - 2.2.2.1 Discrete System of Point Particles *24*
    - 2.2.2.2 Example: Planar Pendulum *26*
    - 2.2.2.3 Continuous Systems of Fields *27*
  - 2.2.3 Symmetries and Conservation Laws *28*
    - 2.2.3.1 Gauge Transformations of the Lagrangian *28*
    - 2.2.3.2 Energy and Momentum Conservation *29*
    - 2.2.3.3 General Space–Time Symmetries *30*
- 2.3 Hamiltonian Mechanics *31*
  - 2.3.1 Hamiltonian Principle and Canonical Equations *31*

2.3.1.1	System of Point Particles	31
2.3.1.2	Continuous System of Fields	32
2.3.2	Poisson Brackets and Conservation Laws	33
2.3.3	Canonical Transformations	34
2.4	Elementary Electrodynamics	35
2.4.1	Maxwell's Equations	36
2.4.2	Energy and Momentum of the Electromagnetic Field	38
2.4.2.1	Energy and Poynting's Theorem	38
2.4.2.2	Momentum and Maxwell's Stress Tensor	39
2.4.2.3	Angular Momentum	40
2.4.3	Plane Electromagnetic Waves in Vacuum	40
2.4.4	Potentials and Gauge Symmetry	42
2.4.4.1	Lorenz Gauge	44
2.4.4.2	Coulomb Gauge	44
2.4.4.3	Retarded Potentials	45
2.4.5	Survey of Electro- and Magnetostatics	45
2.4.5.1	Electrostatics	45
2.4.5.2	Magnetostatics	47
2.4.6	One Classical Particle Subject to Electromagnetic Fields	47
2.4.7	Interaction of Two Moving Charged Particles	50
<b>3</b>	<b>Concepts of Special Relativity</b>	<b>53</b>
3.1	Einstein's Relativity Principle and Lorentz Transformations	53
3.1.1	Deficiencies of Newtonian Mechanics	53
3.1.2	Relativity Principle of Einstein	55
3.1.3	Lorentz Transformations	58
3.1.3.1	Definition of General Lorentz Transformations	58
3.1.3.2	Classification of Lorentz Transformations	59
3.1.3.3	Inverse Lorentz Transformation	60
3.1.4	Scalars, Vectors, and Tensors in Minkowski Space	62
3.1.4.1	Contra- and Covariant Components	62
3.1.4.2	Properties of Scalars, Vectors, and Tensors	63
3.2	Kinematic Effects in Special Relativity	67
3.2.1	Explicit Form of Special Lorentz Transformations	67
3.2.1.1	Lorentz Boost in One Direction	67
3.2.1.2	General Lorentz Boost	70
3.2.2	Length Contraction, Time Dilation, and Proper Time	72
3.2.2.1	Length Contraction	72
3.2.2.2	Time Dilation	73
3.2.2.3	Proper Time	74
3.2.3	Addition of Velocities	75
3.2.3.1	Parallel Velocities	75

	3.2.3.2	General Velocities	77
3.3		Relativistic Dynamics	78
	3.3.1	Elementary Relativistic Dynamics	79
	3.3.1.1	Trajectories and Relativistic Velocity	79
	3.3.1.2	Relativistic Momentum and Energy	79
	3.3.1.3	Energy–Momentum Relation	81
	3.3.2	Equation of Motion	83
	3.3.2.1	Minkowski Force	83
	3.3.2.2	Lorentz Force	85
	3.3.3	Lagrangian and Hamiltonian Formulation	86
	3.3.3.1	Relativistic Free Particle	86
	3.3.3.2	Particle in Electromagnetic Fields	89
3.4		Covariant Electrodynamics	90
	3.4.1	Ingredients	91
	3.4.1.1	Charge–Current Density	91
	3.4.1.2	Gauge Field	91
	3.4.1.3	Field Strength Tensor	92
	3.4.2	Transformation of Electromagnetic Fields	95
	3.4.3	Lagrangian Formulation and Equations of Motion	96
	3.4.3.1	Lagrangian for the Electrodynamical Field	96
	3.4.3.2	Minimal Coupling	97
	3.4.3.3	Euler–Lagrange Equations	99
3.5		Interaction of Two Moving Charged Particles	101
	3.5.1	Scalar and Vector Potentials of a Charge at Rest	102
	3.5.2	Retardation from Lorentz Transformation	104
	3.5.3	General Expression for the Interaction Energy	105
	3.5.4	Interaction Energy at One Instant of Time	105
	3.5.4.1	Taylor Expansion of Potential and Energy	106
	3.5.4.2	Variables of Charge Two at Time of Charge One	107
	3.5.4.3	Final Expansion of the Interaction Energy	108
	3.5.4.4	Expansion of the Retardation Time	110
	3.5.4.5	General Darwin Interaction Energy	110
	3.5.5	Symmetrized Darwin Interaction Energy	112
<b>4</b>		<b>Basics of Quantum Mechanics</b>	<b>117</b>
	4.1	The Quantum Mechanical State	118
	4.1.1	Bracket Notation	118
	4.1.2	Expansion in a Complete Basis Set	119
	4.1.3	Born Interpretation	119
	4.1.4	State Vectors in Hilbert Space	121
	4.2	The Equation of Motion	122

- 4.2.1 Restrictions on the Fundamental Quantum Mechanical Equation 122
- 4.2.2 Time Evolution and Probabilistic Character 123
- 4.2.3 Stationary States 123
- 4.3 Observables 124
  - 4.3.1 Expectation Values 124
  - 4.3.2 Hermitean Operators 125
  - 4.3.3 Unitary Transformations 126
  - 4.3.4 Heisenberg Equation of Motion 127
  - 4.3.5 Hamiltonian in Nonrelativistic Quantum Theory 129
  - 4.3.6 Commutation Relations for Position and Momentum Operators 131
  - 4.3.7 The Schrödinger Velocity Operator 132
  - 4.3.8 Ehrenfest and Hellmann–Feynman Theorems 133
  - 4.3.9 Current Density and Continuity Equation 135
- 4.4 Angular Momentum and Rotations 139
  - 4.4.1 Classical Angular Momentum 139
  - 4.4.2 Orbital Angular Momentum 140
  - 4.4.3 Coupling of Angular Momenta 145
  - 4.4.4 Spin 147
  - 4.4.5 Coupling of Orbital and Spin Angular Momenta 149
- 4.5 Pauli Antisymmetry Principle 155

**Part II — Dirac’s Theory of the Electron**

**159**

**5 Relativistic Theory of the Electron 161**

- 5.1 Correspondence Principle and Klein–Gordon Equation 161
  - 5.1.1 Classical Energy Expression and First Hints from the Correspondence Principle 161
  - 5.1.2 Solutions of the Klein–Gordon Equation 163
  - 5.1.3 The Klein–Gordon Density Distribution 164
- 5.2 Derivation of the Dirac Equation for a Freely Moving Electron 166
  - 5.2.1 Relation to the Klein–Gordon Equation 166
  - 5.2.2 Explicit Expressions for the Dirac Parameters 167
  - 5.2.3 Continuity Equation and Definition of the 4-Current 169
  - 5.2.4 Lorentz Covariance of the Field-Free Dirac Equation 170
    - 5.2.4.1 Covariant Form 170
    - 5.2.4.2 Lorentz Transformation of the Dirac Spinor 171
    - 5.2.4.3 Higher Level of Abstraction and Clifford Algebra 172
- 5.3 Solution of the Free-Electron Dirac Equation 173
  - 5.3.1 Particle at Rest 173
  - 5.3.2 Freely Moving Particle 175

5.3.3	The Dirac Velocity Operator	179
5.4	Dirac Electron in External Electromagnetic Potentials	181
5.4.1	Kinematic Momentum	184
5.4.2	Electromagnetic Interaction Energy Operator	184
5.4.3	Nonrelativistic Limit and Pauli Equation	185
5.5	Interpretation of Negative-Energy States: Dirac's Hole Theory	187
<b>6</b>	<b>The Dirac Hydrogen Atom</b>	<b>193</b>
6.1	Separation of Electronic Motion in a Nuclear Central Field	193
6.2	Schrödinger Hydrogen Atom	197
6.3	Total Angular Momentum	199
6.4	Separation of Angular Coordinates in the Dirac Hamiltonian	200
6.4.1	Spin–Orbit Coupling	200
6.4.2	Relativistic Azimuthal Quantum Number Analog	201
6.4.3	Four-Dimensional Generalization	203
6.4.4	Ansatz for the Spinor	204
6.5	Radial Dirac Equation for Hydrogen-Like Atoms	204
6.5.1	Radial Functions and Orthonormality	205
6.5.2	Radial Eigenvalue Equations	206
6.5.3	Solution of the Coupled Dirac Radial Equations	207
6.5.4	Energy Eigenvalue, Quantization and the Principal Quantum Number	213
6.5.5	The Four-Component Ground State Wave Function	215
6.6	The Nonrelativistic Limit	216
6.7	Choice of the Energy Reference and Matching Energy Scales	218
6.8	Wave Functions and Energy Eigenvalues in the Coulomb Potential	219
6.8.1	Features of Dirac Radial Functions	219
6.8.2	Spectrum of Dirac Hydrogen-like Atoms with Coulombic Potential	221
6.8.3	Radial Density and Expectation Values	223
6.9	Finite Nuclear Size Effects	225
6.9.1	Consequences of the Nuclear Charge Distribution	227
6.9.2	Spinors in External Scalar Potentials of Varying Depth	229
6.10	Momentum Space Representation	233
<b>Part III</b>	<b>— Four-Component Many-Electron Theory</b>	<b>235</b>
<b>7</b>	<b>Quantum Electrodynamics</b>	<b>237</b>
7.1	Elementary Quantities and Notation	237
7.1.1	Lagrangian for Electromagnetic Interactions	237
7.1.2	Lorentz and Gauge Symmetry and Equations of Motion	238

- 7.2 Classical Hamiltonian Description 240
  - 7.2.1 Exact Hamiltonian 240
  - 7.2.2 The Electron–Electron Interaction 241
- 7.3 Second-Quantized Field-Theoretical Formulation 243
- 7.4 Implications for the Description of Atoms and Molecules 246
- 8 First-Quantized Dirac-Based Many-Electron Theory 249**
  - 8.1 Two-Electron Systems and the Breit Equation 250
    - 8.1.1 Dirac Equation Generalized for Two Bound-State Electrons 251
    - 8.1.2 The Gaunt Operator for Unretarded Interactions 253
    - 8.1.3 The Breit Operator for Retarded Interactions 256
    - 8.1.4 Exact Retarded Electromagnetic Interaction Energy 260
    - 8.1.5 Breit Interaction from Quantum Electrodynamics 266
  - 8.2 Quasi-Relativistic Many-Particle Hamiltonians 270
    - 8.2.1 Nonrelativistic Hamiltonian for a Molecular System 270
    - 8.2.2 First-Quantized Relativistic Many-Particle Hamiltonian 272
    - 8.2.3 Pathologies of the First-Quantized Formulation 274
      - 8.2.3.1 Continuum Dissolution 274
      - 8.2.3.2 Projection and No-Pair Hamiltonians 277
    - 8.2.4 Local Model Potentials for One-Particle QED Corrections 278
  - 8.3 Born–Oppenheimer Approximation 279
  - 8.4 Tensor Structure of the Many-Electron Hamiltonian and Wave Function 283
  - 8.5 Approximations to the Many-Electron Wave Function 285
    - 8.5.1 The Independent-Particle Model 286
    - 8.5.2 Configuration Interaction 287
    - 8.5.3 Detour: Explicitly Correlated Wave Functions 291
    - 8.5.4 Orthonormality Constraints and Total Energy Expressions 292
  - 8.6 Second Quantization for the Many-Electron Hamiltonian 296
    - 8.6.1 Creation and Annihilation Operators 296
    - 8.6.2 Reduction of Determinantal Matrix Elements to Matrix Elements Over Spinors 297
    - 8.6.3 Many-Electron Hamiltonian and Energy 299
    - 8.6.4 Fock Space and Occupation Number Vectors 300
    - 8.6.5 Fermions and Bosons 301
  - 8.7 Derivation of Effective One-Particle Equations 301
    - 8.7.1 Avoiding Variational Collapse: The Minimax Principle 302
    - 8.7.2 Variation of the Energy Expression 304
      - 8.7.2.1 Variational Conditions 304
      - 8.7.2.2 The CI Eigenvalue Problem 304
    - 8.7.3 Self-Consistent Field Equations 306
    - 8.7.4 Dirac–Hartree–Fock Equations 309

- 8.7.5 The Relativistic Self-Consistent Field 312
- 8.8 Relativistic Density Functional Theory 313
  - 8.8.1 Electronic Charge and Current Densities for Many Electrons 314
  - 8.8.2 Current-Density Functional Theory 317
  - 8.8.3 The Four-Component Kohn–Sham Model 318
  - 8.8.4 Electron Density and Spin Density in Relativistic DFT 320
  - 8.8.5 Relativistic Spin-DFT 322
  - 8.8.6 Noncollinear Approaches and Collinear Approximations 323
  - 8.8.7 Relation to the Spin Density 324
- 8.9 Completion: The Coupled-Cluster Expansion 325
- 9 Many-Electron Atoms 333**
  - 9.1 Transformation of the Many-Electron Hamiltonian to Polar Coordinates 335
    - 9.1.1 Comment on Units 336
    - 9.1.2 Coulomb Interaction in Polar Coordinates 336
    - 9.1.3 Breit Interaction in Polar Coordinates 337
    - 9.1.4 Atomic Many-Electron Hamiltonian 341
  - 9.2 Atomic Many-Electron Wave Function and *jj*-Coupling 341
  - 9.3 One- and Two-Electron Integrals in Spherical Symmetry 344
    - 9.3.1 One-Electron Integrals 344
    - 9.3.2 Electron–Electron Coulomb Interaction 345
    - 9.3.3 Electron–Electron Frequency-Independent Breit Interaction 349
    - 9.3.4 Calculation of Potential Functions 351
      - 9.3.4.1 First-Order Differential Equations 352
      - 9.3.4.2 Derivation of the Radial Poisson Equation 353
      - 9.3.4.3 Breit Potential Functions 353
  - 9.4 Total Expectation Values 354
    - 9.4.1 General Expression for the Electronic Energy 354
    - 9.4.2 Breit Contribution to the Total Energy 356
    - 9.4.3 Dirac–Hartree–Fock Total Energy of Closed-Shell Atoms 357
  - 9.5 General Self-Consistent-Field Equations and Atomic Spinors 358
    - 9.5.1 Dirac–Hartree–Fock Equations 360
    - 9.5.2 Comparison of Atomic Hartree–Fock and Dirac–Hartree–Fock Theories 361
    - 9.5.3 Relativistic and Nonrelativistic Electron Densities 364
  - 9.6 Analysis of Radial Functions and Potentials at Short and Long Distances 366
    - 9.6.1 Short-Range Behavior of Atomic Spinors 367
      - 9.6.1.1 Cusp-Analogous Condition at the Nucleus 368
      - 9.6.1.2 Coulomb Potential Functions 369
    - 9.6.2 Origin Behavior of Interaction Potentials 370

9.6.3	Short-Range Electron–Electron Coulomb Interaction	371
9.6.4	Exchange Interaction at the Origin	372
9.6.5	Total Electron–Electron Interaction at the Nucleus	376
9.6.6	Asymptotic Behavior of the Interaction Potentials	378
9.7	Numerical Discretization and Solution Techniques	379
9.7.1	Variable Transformations	381
9.7.2	Explicit Transformation Functions	382
9.7.2.1	The Logarithmic Grid	382
9.7.2.2	The Rational Grid	383
9.7.3	Transformed Equations	383
9.7.3.1	SCF Equations	384
9.7.3.2	Regular Solution Functions for Point-Nucleus Case	384
9.7.3.3	Poisson Equations	385
9.7.4	Numerical Solution of Matrix Equations	386
9.7.5	Discretization and Solution of the SCF equations	388
9.7.6	Discretization and Solution of the Poisson Equations	391
9.7.7	Extrapolation Techniques and Other Technical Issues	393
9.8	Results for Total Energies and Radial Functions	395
9.8.1	Electronic Configurations and the Aufbau Principle	397
9.8.2	Radial Functions	397
9.8.3	Effect of the Breit Interaction on Energies and Spinors	399
9.8.4	Effect of the Nuclear Charge Distribution on Total Energies	400
<b>10</b>	<b>General Molecules and Molecular Aggregates</b>	<b>403</b>
10.1	Basis Set Expansion of Molecular Spinors	405
10.1.1	Kinetic Balance	408
10.1.2	Special Choices of Basis Functions	409
10.2	Dirac–Hartree–Fock Electronic Energy in Basis Set Representation	413
10.3	Molecular One- and Two-Electron Integrals	419
10.4	Dirac–Hartree–Fock–Roothaan Matrix Equations	419
10.4.1	Two Possible Routes for the Derivation	420
10.4.2	Treatment of Negative-Energy States	421
10.4.3	Four-Component DFT	422
10.4.4	Symmetry	423
10.4.5	Kramers’ Time Reversal Symmetry	423
10.4.6	Double Groups	424
10.5	Analytic Gradients	425
10.6	Post-Hartree–Fock Methods	428

- 11 Decoupling the Negative-Energy States** 435
- 11.1 Relation of Large and Small Components in One-Electron Equations 435
    - 11.1.1 Restriction on the Potential Energy Operator 436
    - 11.1.2 The  $X$ -Operator Formalism 436
    - 11.1.3 Free-Particle Solutions 439
  - 11.2 Closed-Form Unitary Transformation of the Dirac Hamiltonian 440
  - 11.3 The Free-Particle Foldy–Wouthuysen Transformation 443
  - 11.4 General Parametrization of Unitary Transformations 447
    - 11.4.1 Closed-Form Parametrizations 448
    - 11.4.2 Exactly Unitary Series Expansions 449
    - 11.4.3 Approximate Unitary and Truncated Optimum Transformations 451
  - 11.5 Foldy–Wouthuysen Expansion in Powers of  $1/c$  454
    - 11.5.1 The Lowest-Order Foldy–Wouthuysen Transformation 454
    - 11.5.2 Second-Order Foldy–Wouthuysen Operator: Pauli Hamiltonian 458
    - 11.5.3 Higher-Order Foldy–Wouthuysen Transformations and Their Pathologies 459
  - 11.6 The Infinite-Order Two-Component Two-Step Protocol 462
  - 11.7 Toward Well-Defined Analytic Block-Diagonal Hamiltonians 465
- 12 Douglas–Kroll–Hess Theory** 469
- 12.1 Sequential Unitary Decoupling Transformations 469
  - 12.2 Explicit Form of the DKH Hamiltonians 471
    - 12.2.1 First Unitary Transformation 471
    - 12.2.2 Second Unitary Transformation 472
    - 12.2.3 Third Unitary Transformation 475
  - 12.3 Infinite-Order DKH Hamiltonians and the Arbitrary-Order DKH Method 476
    - 12.3.1 Convergence of DKH Energies and Variational Stability 477
    - 12.3.2 Infinite-Order Protocol 479
    - 12.3.3 Coefficient Dependence 481
    - 12.3.4 Explicit Expressions of the Positive-Energy Hamiltonians 483
    - 12.3.5 Additional Peculiarities of DKH Theory 485
      - 12.3.5.1 Two-Component Electron Density Distribution 486
      - 12.3.5.2 Off-Diagonal Potential Operators 487
      - 12.3.5.3 Nonrelativistic Limit 487
      - 12.3.5.4 Rigorous Analytic Results 488
  - 12.4 Many-Electron DKH Hamiltonians 488
    - 12.4.1 DKH Transformation of One-Electron Terms 488
    - 12.4.2 DKH Transformation of Two-Electron Terms 489

12.5	Computational Aspects of DKH Calculations	492
12.5.1	Exploiting a Resolution of the Identity	494
12.5.2	Advantages of Scalar-Relativistic DKH Hamiltonians	496
12.5.3	Approximations for Complicated Terms	498
12.5.3.1	Spin-Orbit Operators	498
12.5.3.2	Two-Electron Terms	499
12.5.3.3	One-Electron Basis Sets	499
12.5.4	DKH Gradients	500
<b>13</b>	<b>Elimination Techniques</b>	<b>503</b>
13.1	Naive Reduction: Pauli Elimination	503
13.2	Breit-Pauli Theory	507
13.2.1	Foldy-Wouthuysen Transformation of the Breit Equation	508
13.2.2	Transformation of the Two-Electron Interaction	509
13.2.2.1	All-Even Operators	511
13.2.2.2	Transformed Coulomb Contribution	512
13.2.2.3	Transformed Breit Contribution	514
13.2.3	The Breit-Pauli Hamiltonian	518
13.3	The Cowan-Griffin and Wood-Boring Approaches	522
13.4	Elimination for Different Representations of Dirac Matrices	523
13.5	Regular Approximations	524
<b>Part V</b>	<b>— Chemistry with Relativistic Hamiltonians</b>	<b>527</b>
<b>14</b>	<b>Special Computational Techniques</b>	<b>529</b>
14.1	From the Modified Dirac Equation to Exact-Two-Component Methods	530
14.1.1	Normalized Elimination of the Small Component	531
14.1.2	Exact-Decoupling Methods	533
14.1.2.1	The One-Step Solution: X2C	537
14.1.2.2	Two-Step Transformation: BSS	542
14.1.2.3	Expansion of the Transformation: DKH	543
14.1.3	Approximations in Many-Electron Calculations	546
14.1.3.1	The Cumbersome Two-Electron Terms	546
14.1.3.2	Scalar-Relativistic Approximations	547
14.1.4	Numerical Comparison	548
14.2	Locality of Relativistic Contributions	551
14.3	Local Exact Decoupling	553
14.3.1	Atomic Unitary Transformation	554
14.3.2	Local Decomposition of the X-Operator	555
14.3.3	Local Approximations to the Exact-Decoupling Transformation	556
14.3.4	Numerical Comparison	559

- 14.4 Efficient Calculation of Spin–Orbit Coupling Effects 561
- 14.5 Relativistic Effective Core Potentials 564
- 15 External Electromagnetic Fields and Molecular Properties 567**
  - 15.1 Four-Component Perturbation and Response Theory 569
    - 15.1.1 Variational Treatment 570
    - 15.1.2 Perturbation Theory 570
    - 15.1.3 The Dirac-Like One-Electron Picture 573
    - 15.1.4 Two Types of Properties 575
  - 15.2 Reduction to Two-Component Form and Picture Change Artifacts 576
    - 15.2.1 Origin of Picture Change Errors 577
    - 15.2.2 Picture-Change-Free Transformed Properties 580
    - 15.2.3 Foldy–Wouthuysen Transformation of Properties 580
    - 15.2.4 Breit–Pauli Hamiltonian with Electromagnetic Fields 581
  - 15.3 Douglas–Kroll–Hess Property Transformation 582
    - 15.3.1 The Variational DKH Scheme for Perturbing Potentials 583
    - 15.3.2 Most General Electromagnetic Property 584
    - 15.3.3 Perturbative Approach 587
      - 15.3.3.1 Direct DKH Transformation of First-Order Energy 587
      - 15.3.3.2 Expressions of 3rd Order in Unperturbed Potential 589
      - 15.3.3.3 Alternative Transformation for First-Order Energy 590
    - 15.3.4 Automated Generation of DKH Property Operators 592
    - 15.3.5 Consequences for the Electron Density Distribution 593
    - 15.3.6 DKH Perturbation Theory with Magnetic Fields 595
  - 15.4 Magnetic Fields in Resonance Spectroscopies 595
    - 15.4.1 The Notorious Diamagnetic Term 595
    - 15.4.2 Gauge Origin and London Orbitals 596
    - 15.4.3 Explicit Form of Perturbation Operators 597
    - 15.4.4 Spin Hamiltonian 598
  - 15.5 Electric Field Gradient and Nuclear Quadrupole Moment 599
  - 15.6 Parity Violation and Electro-Weak Chemistry 602
- 16 Relativistic Effects in Chemistry 605**
  - 16.1 Effects in Atoms with Consequences for Chemical Bonding 608
  - 16.2 Is Spin a Relativistic Effect? 612
  - 16.3 Z-Dependence of Relativistic Effects: Perturbation Theory 613
  - 16.4 Potential Energy Surfaces and Spectroscopic Parameters 614
    - 16.4.1 Dihydrogen 616
    - 16.4.2 Thallium Hydride 617
    - 16.4.3 The Gold Dimer 619
    - 16.4.4 Tin Oxide and Cesium Hydride 622

- 16.5 Lanthanides and Actinides 622
  - 16.5.1 Lanthanide and Actinide Contraction 623
  - 16.5.2 Electronic Spectra of Actinide Compounds 623
- 16.6 Electron Density of Transition Metal Complexes 625
- 16.7 Relativistic Quantum Chemical Calculations in Practice 629

**Appendix****631****A Vector and Tensor Calculus 633**

- A.1 Three-Dimensional Expressions 633
  - A.1.1 Algebraic Vector and Tensor Operations 633
  - A.1.2 Differential Vector Operations 634
  - A.1.3 Integral Theorems and Distributions 635
  - A.1.4 Total Differentials and Time Derivatives 637
- A.2 Four-Dimensional Expressions 638
  - A.2.1 Algebraic Vector and Tensor Operations 638
  - A.2.2 Differential Vector Operations 638

**B Kinetic Energy in Generalized Coordinates 641****C Technical Proofs for Special Relativity 643**

- C.1 Invariance of Space-Time Interval 643
- C.2 Uniqueness of Lorentz Transformations 644
- C.3 Useful Trigonometric and Hyperbolic Formulae for Lorentz Transformations 646

**D Relations for Pauli and Dirac Matrices 649**

- D.1 Pauli Spin Matrices 649
- D.2 Dirac's Relation 650
  - D.2.1 Momenta and Vector Fields 651
  - D.2.2 Four-Dimensional Generalization 652

**E Fourier Transformations 653**

- E.1 Definition and General Properties 653
- E.2 Fourier Transformation of the Coulomb Potential 654

**F Gordon Decomposition 657**

- F.1 One-Electron Case 657
- F.2 Many-Electron Case 659

**G Discretization and Quadrature Schemes 661**

- G.1 Numerov Approach toward Second-Order Differential Equations 661

- G.2 Numerov Approach for First-Order Differential Equations 663
- G.3 Simpson's Quadrature Formula 665
- G.4 Bickley's Central-Difference Formulae 665
