Preface *xiii*

1	Preparation of Artificial Metalloenzymes	1
	<i>Jared C. Lewis and Ken Ellis-Guardiola</i>	
1.1	Introduction	1
1.2	ArM Formation via Metal Binding	2
1.2.1	Repurposing Natural Metalloenzymes	2
1.2.1.1	Carboxypeptidase A	3
1.2.1.2	Carbonic Anhydrase	3
1.2.1.3	Metallo- β -lactamase	4
1.2.1.4	Ferritin	5
1.2.2	Exploiting Serendipitous Metal Binding by Proteins	6
1.2.3	Designing Metal-Binding Sites in Scaffold Proteins	8
1.2.4	Introducing Metal-Binding Sites Using Unnatural Amino Acids	11
1.3	ArM Formation via Supramolecular Interactions	13
1.3.1	Cofactor Binding	14
1.3.1.1	Heme Proteins	14
1.3.1.2	Xylanases	16
1.3.1.3	Serum Albumins	17
1.3.1.4	Lactococcal Multidrug Resistance Regulator	18
1.3.1.5	NikA	18
1.3.1.6	Antibodies	19
1.3.2	Cofactor Anchoring	20
1.3.2.1	(Strept)avidin	20
1.3.2.2	Other Anchoring Scaffolds	22
1.3.2.3	Carboxyanhydrase	22
1.4	ArM Formation via Covalent Linkage	23
1.4.1	Activated Serine and Cysteine Residues	23
1.4.2	Lysine Residues	27
1.4.3	Cysteine Residues	27
1.4.4	Azido Phenylalanine	30
1.5	Conclusion	31
	Acknowledgments	32
	References	32

2	Preparation of MetalloDNAzymes	41
	<i>Claire E. McGhee, Ryan J. Lake, and Yi Lu</i>	
2.1	Introduction	41
2.2	<i>In Vitro</i> Selection of MetalloDNAzymes in the Presence of Metal Ions	44
2.2.1	Designing a DNAzyme Pool	45
2.2.1.1	Sequence Space	45
2.2.1.2	Choosing the Length of a Random Region	46
2.2.2	Performing <i>In Vitro</i> Selection	46
2.2.2.1	Isolation of Reactive DNA Sequences	47
2.2.2.2	Negative Selection	49
2.2.2.3	Pool Regeneration	49
2.2.2.4	Monitoring Selection Progress	51
2.2.2.5	Sequencing	51
2.2.2.6	Sequence Analysis	52
2.2.3	Optimization of DNAzymes via Truncation and <i>Cis-to-Trans</i> Transformation	52
2.2.4	Reselection of DNAzymes	53
2.3	From <i>In Vitro</i> Selection to Design of MetalloDNAzymes in the Presence of Metallocofactors	53
2.4	Design and Preparation of DNA-Based Hybrid Catalysts	54
2.4.1	Supramolecularly Anchored DNA-Based Hybrid Catalysts	54
2.4.2	Covalently Anchored DNA-Based Hybrid Catalysts	57
2.5	Summary and Future Directions	58
	Acknowledgments	59
	References	59
3	Experimental Characterization Techniques of Hybrid Catalysts	69
	<i>Juan Mangas-Sánchez and Eduardo Busto</i>	
3.1	Introduction	69
3.2	Characterization of Modified Naturally Occurring Metalloproteins	69
3.3	Characterization of New Metalloenzymes Created from Metal-Free Proteins	73
3.3.1	Characterization of Metalloenzymes Obtained through Direct Metal Salt Complexation	73
3.3.2	Characterization of Metalloenzymes Obtained via Covalent Anchorage	77
3.3.3	Characterization of Artificial Metalloenzymes via Non-covalent Supramolecular Anchoring	84
3.3.4	Experimental Characterization of Artificial Metalloenzymes with Dual Activities	87
3.4	Characterization of DNAzymes	88
3.5	Conclusions	92
	Acknowledgments	92
	References	92

4	Computational Studies of Artificial Metalloenzymes: From Methods and Models to Design and Optimization	99
	<i>Jaime Rodríguez-Guerra, Lur Alonso-Cotchico, Giuseppe Sciortino, Agustí Lledós, and Jean-Didier Maréchal</i>	
4.1	Introduction	99
4.2	From Computational Transition Metal Catalysis to Artificial Metalloenzymes Design	100
4.3	The Toolbox of the Artificial Enzyme Modeler	105
4.3.1	Few Generalities on Molecular Modeling	105
4.3.2	Accurate Physical Models	106
4.3.3	Simplified Physical Models	109
4.3.4	Advantages of MM-Like Methods	109
4.3.5	Hybrid and Multiscale Models	112
4.4	Application of Computational Methods to the Optimization and Design of Artificial Metalloenzymes	113
4.4.1	Modifying Naturally Occurring Metalloenzymes	113
4.4.1.1	Optimizing Biomolecule–Cofactor and Biohybrid–Substrate Binding	113
4.4.1.2	Accounting for Changes in the First Coordination Sphere	115
4.4.1.3	Computational Redesign of Native Metalloenzyme Activity and Selectivity	116
4.4.1.4	Mechanistic Elucidation of Redesigned Metalloenzymes	117
4.4.2	Generation of Artificial Metalloenzymes from Metal-Free Enzymes	119
4.4.2.1	<i>De Novo</i> Artificial Metalloenzymes: A General Overview	119
4.4.2.2	The Particularities of <i>De Novo</i> Metalloenzymes	121
4.4.2.3	Protein Interactions with Artificial Cofactors	122
4.4.2.4	Substrate Binding and Complete Mechanism	125
4.5	Outlook	127
4.6	Conclusion	128
	Acknowledgments	128
	References	129
5	Directed Evolution of Artificial Metalloenzymes: Bridging Synthetic Chemistry and Biology	137
	<i>Ruijie K. Zhang, David K. Romney, S. B. Jennifer Kan, and Frances H. Arnold</i>	
5.1	Evolution Enables Chemical Innovation	137
5.1.1	Strategies for Directed Evolution	138
5.1.2	Directed Evolution as an Uphill Walk in the Protein Fitness Landscape	139
5.2	Directed Evolution Applied to Natural Metalloenzymes	140
5.2.1	Enhancing the Stability of a Carbonic Anhydrase	140
5.2.2	Expanding the Scope of P450-Catalyzed Oxidation Reactions	142
5.3	Directed Evolution of Hemoproteins for Abiological Catalysis	144
5.3.1	Nonnatural Carbene Transfer Reactions with Engineered P450 _{BM3} Variants	145

- 5.3.2 Nonnatural Nitrene Transfer Reactions with Engineered P450_{BM3} Variants 146
- 5.3.3 Engineering Cytochrome *c* for Nonnatural Catalysis 151
- 5.3.4 Engineering Myoglobin for Nonnatural Catalysis 151
- 5.3.5 Directed Evolution of Myoglobin-Derived Catalysts Created through Metal-Ion Replacement 154
- 5.4 Metalloenzymes with Artificial Cofactors or Metal-Binding Sites 155
 - 5.4.1 Artificial Hydrolase with Biotic Metal Ions in *De Novo* Binding Sites 155
 - 5.4.2 Artificial Hydrogenases Derived from Streptavidin 157
 - 5.4.3 Cross-Coupling with a Pd–Streptavidin Conjugate 160
 - 5.4.4 Alkene Metathesis Catalyzed by an Ru–Streptavidin Conjugate 160
 - 5.4.5 Carbene Transfer with Conjugate of Rhodium and Proline Oligopeptidase 162
- 5.5 Conclusion 164
 - Acknowledgments 166
 - References 166

- 6 Artificial Metalloenzymes for Hydrogenation and Transfer Hydrogenation Reactions 171**
Manuel Basauri-Molina and Robertus J. M. Klein Gebbink
 - 6.1 Impact of Metallohydrogenases in the Field of Artificial Metalloenzymes 171
 - 6.2 Biotinylated Metal Complexes in Avidin and Streptavidin 173
 - 6.2.1 Hydrogenation of *N*-Protected Amino Acids 173
 - 6.2.2 Transfer Hydrogenation of Ketones 178
 - 6.2.3 Transfer Hydrogenation of Imines 180
 - 6.2.4 ATHases in Cascade Reactions 182
 - 6.3 Artificial Enzymes with Covalent Metalloprotein Constitution 184
 - 6.3.1 Papain and Photoactive Yellow Protein 184
 - 6.3.2 Serine Proteases 188
 - 6.3.3 Human Carbonic Anhydrase 191
 - 6.4 Chemocatalysts Embedded in Protein Motifs 191
 - 6.5 Conclusions 193
 - References 194

- 7 Hybrid Catalysts for Oxidation Reactions 199**
Christine Cavazza, Caroline Marchi-Delapierre, and Stéphane Ménage
 - 7.1 Metal Switch 201
 - 7.2 Structural Modulation of Natural Enzymes 201
 - 7.3 Cofactor Replacement: Reconstitution Strategy 206
 - 7.4 Rational Design of Enzymes 209
 - 7.5 *De Novo* Synthetic Active Site 211
 - 7.6 *De Novo* Protein Scaffold 216
 - 7.7 Concluding Remarks 219
 - References 220

8	Hybrid Catalysts as Lewis Acid	225
	<i>Gerard Roelfes, Ivana Drienovská, and Lara Villarino</i>	
8.1	Introduction	225
8.2	C–C Bond-Forming Reactions	225
8.2.1	Diels–Alder Reactions	225
8.2.1.1	DNA-Based Hybrid Catalysts	226
8.2.1.2	Metallopeptide-Based Hybrid Catalyst	231
8.2.1.3	Protein-Based Hybrid Catalysts	231
8.2.2	Conjugate Addition Reactions	236
8.2.2.1	Michael Addition	236
8.2.2.2	Friedel–Crafts Alkylation	238
8.3	C–X Bond-Forming Reactions	240
8.3.1	Oxa-Michael Additions	240
8.3.1.1	DNA-Based Hybrid Catalyst	242
8.3.1.2	Protein-Based Hybrid Catalysts	242
8.3.2	Fluorinations	243
8.4	Hydrolytic Reactions	244
8.4.1	DNA-Based Hybrid Catalyst	244
8.4.2	Protein-Based Hybrid Catalyst	244
8.5	Conclusions and Outlook	246
	References	246
9	Hybrid Catalysts for C–H Activation and Other X–H Insertion Reactions	253
	<i>Thomas R. Ward and Michela M. Pellizzoni</i>	
9.1	General Introduction	253
9.2	Artificial Metalloenzymes for C–H Insertion	253
9.2.1	Introduction	253
9.2.2	Artificial Metalloenzymes Based on the Biotin–Streptavidin Technology	254
9.2.3	Artificial Metalloenzymes Based on the Myoglobin Scaffold	257
9.2.4	Artificial Metalloenzymes Based on POP Scaffold	260
9.2.4.1	Si–H insertion	260
9.2.4.2	Cyclopropanation	261
9.3	Repurposing Hemoproteins for C–H Insertion Reactions	262
9.3.1	Introduction	262
9.3.2	Cyclopropanation	262
9.3.3	Aziridination	265
9.3.4	C–H Amination	266
9.3.5	N–H Insertion	269
9.3.6	S–H Insertion	271
9.3.7	Sulfimidation	274
9.3.8	Sigmatropic Rearrangement	275
9.3.9	Halogenation	276
9.4	Conclusion	279
	References	279

- 10 Hybrid Catalysts for Other C–C and C–X Bond Formation Reactions** 285
Peter J. Deuss, Megan V. Doble, Amanda G. Jarvis, and Paul C.J. Kamer
- 10.1 Introduction 285
- 10.2 Allylic Substitution 286
- 10.2.1 Chiral Phosphane Ligands Based on Chiral Building Blocks from Nature 286
- 10.2.2 Phosphane-Modified Synthetic Polypeptides 287
- 10.2.3 Phosphane-Modified Proteins 289
- 10.2.4 Oligonucleotides-Based Hybrid Catalysts 291
- 10.3 Palladium-Catalyzed Cross-Coupling Reactions 296
- 10.4 Hydroformylation 302
- 10.5 Phenylacetylene Polymerization 304
- 10.6 Olefin Metathesis 307
- 10.7 Summary and Future Trends 312
- Acknowledgments 314
- References 314
- 11 Metal–Enzyme Hybrid Catalysts in Cascade and Multicomponent Processes** 321
Boi Hoa San, Jess Gusthart, Seung Seo Lee, and Kyeong Kyu Kim
- 11.1 Introduction 321
- 11.2 Metal-Based Catalyst Hybrids with Enzymes for Cascade and Multicomponent Processes 322
- 11.2.1 Gold Nanoparticle-Based Enzyme Hybrid 324
- 11.2.2 Palladium and Platinum Nanoparticle-Based Enzyme Hybrids 326
- 11.2.3 Other Metals Used for Metal–Enzyme Hybrid Catalysts 330
- 11.2.4 Organometallic Material Hybrid with Protein/Enzyme 333
- 11.3 Design Strategy for Metal–Enzyme Hybrid Catalysts in Multicomponent Cascade Reactions 334
- 11.3.1 Design Strategies for Developing Multistep Reactions in Metal–Enzyme Hybrid Catalysts 335
- 11.4 Reaction Mechanisms of Metal–Enzyme Hybrid Catalysts in Multicomponent Cascade Reactions 339
- 11.4.1 Examples of Cascade Reactions 340
- 11.4.2 Mechanisms of Commonly Used Enzymes 341
- 11.5 Conclusion and Future Perspectives 343
- Acknowledgments 343
- References 343
- 12 Metalloenzyme-Inspired Systems for Alternative Energy Harvest** 353
Markus D. Kärkäs, Oscar Verho, and Björn Åkermark
- 12.1 Introduction: Artificial Photosynthesis 353
- 12.2 Hydrogen Evolution 355
- 12.2.1 Hydrogenases: Iron-Based Metalloenzymes for Hydrogen Evolution 355

12.2.2	Other Metal-Based Biohybrid Systems for Hydrogen Production	363
12.3	Hybrid Systems for Overall Water Splitting	364
12.4	Bioinspired Systems for O ₂ Reduction	364
12.4.1	Simple Bioelectrodes for Applications in Biosensing	366
12.4.2	Multicatalytic Hybrid Systems for More Efficient Bioelectrodes	367
12.4.3	Future Directions in Bioelectrocatalysis Research	370
12.5	Conclusions and Outlook	372
	Acknowledgments	373
	References	373
13	Synthesis and Application of Hybrid Catalysts with Metalloenzyme-Like Properties	383
	<i>Jose M. Palomo</i>	
13.1	Introduction	383
13.2	Synthesis of Pd Nanobiohybrids (Pd(0)NPs-Enzyme Hybrids)	384
13.3	Synthesis of Au Nanobiohybrids	387
13.4	Synthesis of Ag Nanobiohybrids	391
13.5	Synthesis of Cu Nanobiohybrids	392
13.6	Synthesis of Pt Nanobiohybrids	394
13.7	Chemical Applications of Nanobiohybrids	395
13.7.1	Synergistic Effect	396
13.7.2	Dual Activity in Cascade Processes	396
13.8	Conclusions	399
