Contents

Introduction 1

- 1 Macroscopic Characteristics of Strain of Metallic Materials at High Temperatures 5
- 2 In situ X-ray Investigation Technique 13
- 2.1 Experimental Installation 13
- 2.2 Measurement Procedure 15
- 2.3 Measurements of Structural Parameters 17
- 2.4 Diffraction Electron Microscopy 20
- 2.5 Amplitude of Atomic Vibrations 21
- 2.6 Materials under Investigation 23
- 2.7 Summary 24

3 Structural Parameters in High-Temperature Deformed Metals 25

- 3.1 Evolution of Structural Parameters 25
- 3.2 Dislocation Structure 30
- 3.3 Distances between Dislocations in Sub-boundaries 34
- 3.4 Sub-boundaries as Dislocation Sources and Obstacles 34
- 3.5 Dislocations inside Subgrains 35
- 3.6 Vacancy Loops and Helicoids 39
- 3.7 Total Combination of Structural Peculiarities of High-temperature Deformation 40
- 3.8 Summary 41

4 Physical Mechanism of Strain at High Temperatures 43

- 4.1 Physical Model and Theory 43
- 4.2 Velocity of Dislocations 45
- 4.3 Dislocation Density 49
- 4.4 Rate of the Steady-State Creep 51

High Temperature Strain of Metals and Alloys, Valim Levitin (Author) Copyright © 2006 WILEY-VCH Verlag GmbH & Co. KGaA, Weinheim ISBN: 3-527-313389-9

- VI Contents
 - 4.5 Effect of Alloying: Relationship between Creep Rate and Mean-Square Atomic Amplitudes 54
 - 4.6 Formation of Jogs 55
 - 4.7 Significance of the Stacking Faults Energy 57
 - 4.8 Stability of Dislocation Sub-boundaries 58
 - 4.9 Scope of the Theory 62
 - 4.10 Summary 64

5 Simulation of the Parameters Evolution 67

- 5.1 Parameters of the Physical Model 67
- 5.2 Equations 68
- 5.2.1 Strain Rate 68
- 5.2.2 Change in the Dislocation Density 68
- 5.2.3 The Dislocation Slip Velocity 69
- 5.2.4 The Dislocation Climb Velocity 69
- 5.2.5 The Dislocation Spacing in Sub-boundaries 70
- 5.2.6 Variation of the Subgrain Size 71
- 5.2.7 System of Differential Equations 71
- 5.3 Results of Simulation 71
- 5.4 Density of Dislocations during Stationary Creep 77
- 5.5 Summary 80

6 High-temperature Deformation of Superalloys 83

- 6.1 γ' Phase in Superalloys 83
- 6.2 Changes in the Matrix of Alloys during Strain 88
- 6.3 Interaction of Dislocations and Particles 89
- 6.4 Creep Rate. Length of Dislocation Segments 95
- 6.5 Mechanism of Strain and the Creep Rate Equation 96
- 6.6 Composition of the γ' Phase and Atomic Vibrations 102
- 6.7 Influence of the Particle Size and Concentration 104
- 6.8 The Prediction of Properties 106
- 6.9 Summary 109

7 Single Crystals of Superalloys 111

- 7.1 Effect of Orientation on Properties 111
- 7.2 Deformation at Lower Temperatures 116
- 7.3 Deformation at Higher Temperatures 124
- 7.4 On the Composition of Superalloys 129
- 7.5 Rafting 130
- 7.6 Effect of Composition and Temperature on γ/γ' Misfit 136
- 7.7 Other Creep Equations 137
- 7.8 Summary 141

8 Deformation of Some Refractory Metals 143

- 8.1 The Creep Behavior 143
- 8.2 Alloys of Refractory Metals 149
- 8.3 Summary 155

Supplements 157

Supplement 1: On Dislocations in the Crystal Lattice 157 Supplement 2: On Screw Components in Sub-boundary Dislocation Networks 161 Supplement 3: Composition of Superalloys 163
