

Index

a

agglomeration 286
 Alfrey–Goldfinger equation 255
 Arrhenius law 152, 153
 autoclaves 105–106

b

Bernoullian model 145, 146, 147, 212, 232, 233
 bimetallic mechanisms 83
 bimodal polyethylenes 8
 Borstar process 118, 127
 buildup rate 117
 bulk density 277

c

chain length distribution (CLD) 188, 190, 191–194, 199
 – non-steady-state reactor operation effect on 195–197
 chain transfer 79, 80
 – agent 311
 – steps, for terminal model 213
 chain walking 67–68, 68
 – Monte Carlo simulation of polyethylene SCB distribution by 259–262
 chemical composition distribution (CCD) 6–9, 12, 54, 55, 256
 – crystallizability-based techniques 29–40
 – high-performance liquid chromatography 40–43
 – multiple-site catalysts 222–232
 – single-site catalysts 212–222
 cocatalyst 57, 66, 77–78, 78, 80, 81, 85, 100, 131, 132, , 135, 144, 155, 162, 165, 263
 comonomer effect 148
 – on polymerization rate 173–179

comonomer sequence length distribution (CSLD) 232–237
 condensed mode operation 96–97
 constrained geometry catalyst (CGC). *See* half sandwich metallocene
 convection 292, 293
 – in particles 301–304
 coordination catalysts 76–86
 copolymerization 5, 6, 10, 63, 67, 70, 83, 122, 126, 132, 145–149, 170, 173, 174, 175, 177–178, 179, 212, 214, 237, 251, 290, 297
 – models 213
 – terminal model 80, 81
 Cossee's mechanism 81, 82, 83
 cross-fractionation techniques 43–46
 crystallizability-based techniques 29–40
 crystallization analysis fractionation (CRYSTAF) 33–36, 218–220, 219, 224
 crystallization elution fractionation (CEF) 36, 37, 39
 cumulative distribution 34

d

deashing 112, 122
 differential distribution 34
 differential scanning calorimetry (DSC) 15, 38–40
 diffusion 18, 28, 179, 181, 276, 288, 289, 293–294, 295, 301, 302, 304, 305–306
 donors 59
 dormant β -agostic interaction site models
 – comparison with slow metal hydride 167–169
 – hydrogen effect and α -olefin concentration on ethylene copolymerization rate using 177–178
 Dowlex process 120
 drop-in technology 66

e

- effective diffusivity 289
- elution volume 17
- evaporative light scattering detector (ELSD) 41
- external donors 59

f

- Fick's law 28
- field flow fractionation 27–28
- finest generation 277, 286
- Flory distribution 188, 190, 191, 192, 193, 194, 198–201, 207, 216
- MWD deconvolution of polyethylene sample with heterogeneous Ziegler–Natta catalyst using 208–212
- Flory–Schulz most probable distribution. *See* Flory distribution
- fluidized bed reactor (FBR) 89, 91–97, 115, 116, 118, 312, 317, 319

g

- gas-phase reactors 90–91, 132
- fluidized bed 91–97
- horizontal stirred 99–102
- multizone circulating 102–104
- vertical stirred bed 97–99
- gel permeation chromatography (GPC) 17, 22–23, 24, 26–28, 45, 229
- good morphology 277

h

- half sandwich metallocene 63
- heat transfer 272, 273, 288, 291, 292, 293, 294, 296, 300, 301
- high-density polyethylene (HDPE) 4–5, 9
- high-performance liquid chromatography (HPLC) techniques 15, 40–43
- homopolymerization 134–145
- trigger mechanism for 157
- Horizone process 124
- horizontal stirred gas-phase reactor 99–102
- Hostalen process 112, 113
- hydrogen effect 83–85
- on polymerization rate 161–173

i

- industrial reactors, developing models for 311–321
- Innovene process 116, 124
- internal donors 59
- isotactic polypropylene 80

l

- late transition metal catalysts 67–70
- linear low-density polyethylene (LLDPE) 5–7, 8, 9, 228
- long chain approximation (LCA) 147, 148
- long-chain branching 2, 5, 9, 10, 46–51, 237–250
- microstructure investigation, from average polymer properties 245–248
- loop reactors 105, 106–107, 114, 321
- low-density polyethylene (LDPE) 2, 3, 4, 5, 10

m

- macromonomers 63, 77, 78
- mass transfer 173, 179, 272, 273, 278, 286, 287, 288, 289, 293, 294, 295, 296, 297, 298–299, 301–304, 305
- metallocenes 2, 5, 9, 11, 12, 31, 35, 36, 40, 42, 44, 54, 55, 62–67, 70, 73–75, 76, 78, 81, 104, 114, 117, 120, 137, 139, 154, 156, 162, 169, 218, 281, 283
- methylaluminoxane (MAO) 62, 65–66
- micrograins 274, 275, 292
- microstructural characterization 15–17
- chemical composition distribution
- – crystallizability-based techniques 29–40
- – high-performance liquid chromatography 40–43
- cross-fractionation techniques 43–46
- long-chain branching 46–51
- molecular weight distribution 17
- – field flow fractionation 27–28
- – size exclusion chromatography 17–27
- microstructural modeling 187
- instantaneous distributions 188
- – chemical composition distribution 212–232
- – comonomer sequence length distribution 232–237
- – long-chain branching distribution 237–250
- – molecular weight distribution 188–212
- – polypropylene 250–251
- Monte Carlo simulation 251–252
- – dynamic models 262–268
- – steady-state models 252–262
- Mitsui Hypol process 126
- molar flow rate 315
- molecular weight distributions (MWDs) 54, 55, 61, 63, 95, 101, 103, 106, 108, 110, 111, 114, 120, 125, 230
- deconvolution 200, 201–206, 208–211, 225–229

- experimental profiles prediction measured by GPC 248–249
- field flow fractionation 27–28
- multiple-site catalysts 199–212
- single-site catalysts 188–199
- size exclusion chromatography 17–27
- monomer diffusivity 289, 290
- Monte Carlo simulation 251–252
- dynamic models 262–268
- steady-state models 252–262
- multigrain model (MGM) 287–292
- limitations 304–307
- multiple-site catalysts 149–152
- chemical composition distribution 222–232
- molecular weight distributions 199–212
- triad distributions for copolymers with model 234–237
- multizone circulating reactor 102–104

- n**
- negative polymerization orders, with late transition metal catalysts 179–181
- Novolen process 123

- o**
- olefin polymerization *See individual entries*
- α -olefins 1–2, 5–8, 19, 26, 29, 31, 38, 41, 47, 48, 50, 61, 63, 76, 77, 81, 83, 89, 107, 120, 173–174, 177–178, 179, 187
- orthodichlorobenzene (ODCB) 17, 30

- p**
- particle size distribution 317, 318
- pen-penultimate model 212
- penultimate model 146, 212
- Phillips catalyst 2, 5, 53, 54, 55, 56, 61, 66, 76, 78, 83, 132, 149, 151, 200, 201, 205, 313
- Phillips process 114
- plug flow reactor 98
- polydispersity 192, 197
- polyethylene manufacturing processes
 - gas-phase processes 115–118
 - mixed-phase processes 118–119
 - slurry (inert diluent) processes 112–115
 - solution processes 119–121
- polyethylene resins 4–10
- polymer density 277
- polymer flow model (PFM) 287, 292–295, 313, 321
- limitations 304–307
- polymerization catalysis and mechanism 53–56
- catalyst types
 - - late transition metal catalysts 67–70
 - - metallocenes 62–67
 - - Phillips catalysts 61
 - - Ziegler–Natta catalysts 56–61
 - with coordination catalysts 76–86
 - supporting single-site catalysts 70–76
- polymerization kinetics 131–133
 - fundamental model for 134
 - - kinetic constants temperature dependence 152–154
 - - multiple-site catalysts 149–152
 - - number of moles of active sites 154–156
 - - single-site catalysts 134–149, 157–161
- nonstandard models 156
- comonomer effect on polymerization rate 173–179
 - - hydrogen effect on polymerization rate 161–173
 - - negative polymerization orders with late transition metal catalysts 179–181
 - - polymerization orders greater than one 156–161
 - for second-order deactivation and noninstantaneous activation 144–145
- vapor-liquid-solid equilibrium considerations 181, 183–184
- polyolefins 1–4. *See also individual entries*
