**Introduction** *1*

|          |                                                                                                        |          |
|----------|--------------------------------------------------------------------------------------------------------|----------|
| <b>1</b> | <b>Are Species Constructs of the Human Mind?</b>                                                       | <b>5</b> |
| <b>2</b> | <b>Why is there a Species Problem?</b>                                                                 | <b>9</b> |
| 2.1      | Objective of the Book                                                                                  | 9        |
| 2.2      | Can Species be Defined and Delimited from one Another?                                                 | 10       |
| 2.3      | What Makes Biological Species so Special?                                                              | 12       |
| 2.4      | Species: To Exist, or not to Exist, that is the Question                                               | 15       |
| 2.5      | The Reality of Species: Ernst Mayr vs. Charles Darwin                                                  | 19       |
| 2.6      | The Constant Change in Evolution and the Quest of Taxonomy for Fixed Classes: can these be Compatible? | 20       |
| 2.7      | Can a Scientist Work with a Species Without Knowing what a Species is?                                 | 23       |
| 2.8      | The Species as an Intuitive Concept and a Cognitive Preset in the Human Mind                           | 24       |
| 2.9      | Taxonomy's Status as a "Soft" or "Hard Science"                                                        | 27       |
| 2.10     | The Impact of the Species Concept on Nature Conservation and the Allocation of Tax Money               | 30       |
| 2.11     | Sociological Consequences of a Misunderstood Concept of Race                                           | 31       |
| 2.12     | Species Pluralism: How Many Species Concepts Exist?                                                    | 33       |
| 2.13     | It is One Thing to Identify a Species, but Another to Define what a Species is                         | 39       |
| 2.14     | The Dualism of the Species Concept: the Epistemic vs. the Operative Goal                               | 41       |

|          |                                                                                                                          |           |
|----------|--------------------------------------------------------------------------------------------------------------------------|-----------|
| <b>3</b> | <b>Is the Biological Species a Class or is it an Individual?</b>                                                         | <b>45</b> |
| 3.1      | Preliminary Note: Can a Species have Essential Traits?                                                                   | 45        |
| 3.2      | Class Formation and Relational Group Formation                                                                           | 47        |
| 3.3      | Is the Biological Species a Universal/Class or an Individual?                                                            | 49        |
| 3.4      | The Difference Between a Group of Objects as a Class and a Group of Objects as an Individual is a Fundamental One        | 51        |
| 3.5      | Artificial Classes and Natural Kinds                                                                                     | 54        |
| 3.6      | The Biological Species Cannot be a Natural Kind                                                                          | 56        |
| 3.7      | The Biological Species as a Homeostatic Property Cluster                                                                 | 58        |
| 3.8      | Polythetic Class Formation or Grouping According to Family Resemblance                                                   | 60        |
| 3.9      | The Linnaean System is Based on Fundamental Assumptions that are Irreconcilable with a Contemporary Worldview of Science | 61        |
| 3.10     | Comparison of the System of Organisms with the Periodic Table of Chemical Elements                                       | 63        |
| 3.11     | The Relational Properties of the Members of a Species are the Essence of the Species                                     | 64        |
| <br>     |                                                                                                                          |           |
| <b>4</b> | <b>What are Traits in Taxonomy?</b>                                                                                      | <b>67</b> |
| 4.1      | Preliminary Note                                                                                                         | 67        |
| 4.2      | What Basic Rule Defines Traits as Being Taxonomically Relevant?                                                          | 68        |
| 4.3      | What is the Relevance of Differences in Genes Between Two Species?                                                       | 71        |
| 4.4      | In Sticklebacks ( <i>Gasterosteus aculeatus</i> ), a Single Gene Controls Many Phenotypes                                | 73        |
| 4.5      | What is the Relevance of Differences in Traits between Two Species?                                                      | 74        |
| 4.6      | Traits that are Used by the Species to Distinguish Themselves                                                            | 76        |
| 4.7      | A Species cannot be Defined by Traits                                                                                    | 80        |
| 4.8      | What are Homologous Traits?                                                                                              | 82        |
| 4.9      | The Vertebrate Eye and the Squid Eye: They Cannot be Homologous Nor can they be Non-Homologous                           | 84        |
| 4.10     | The DNA Barcoding Approach – is Taxonomy Nothing more than Phylogenetic Distance?                                        | 86        |
| <br>     |                                                                                                                          |           |
| <b>5</b> | <b>Diversity within the Species: Polymorphisms and the Polytypic Species</b>                                             | <b>93</b> |
| 5.1      | Preliminary Note                                                                                                         | 93        |
| 5.2      | Differences in Traits do not Necessarily Mean Species Differences                                                        | 94        |
| 5.3      | Superfluous Taxonomic Terms: Variation, Aberration, Form, Phase, Phenon                                                  | 96        |
| 5.4      | What are Races or Subspecies?                                                                                            | 97        |

- 5.5 Are Carrion Crow and Hooded Crow (*Corvus corone* and *C. cornix*)  
in Eurasia and the Guppy Populations on Trinidad  
Species or Races? 99
- 5.6 What are Morphs? 100
- 5.7 What are Mutants (in a Taxonomic Sense)? 103
- 5.8 Allelic Diversity 104
- 5.9 How Long is the Lifetime of Allelic Polymorphisms? 105
- 5.10 Stable Polymorphisms – The Selective Advantage is Diversity 106
- 5.11 Are Differences between Species Due only to Differences in  
Allelic Frequency Distribution, Such that there are no Truly  
Species-Specific Traits? 108
- 5.12 Partially Migratory Birds – an Example of Genetic  
Polymorphisms 110
- 5.13 Intraspecies Morphs in the Burnet Moth *Zygaena ephialtes* 114
- 5.14 The Color Pattern Polymorphism of the Shells of the  
Brown-Lipped Snail *Cepaea nemoralis* 116
- 5.15 The Beak Polymorphism in the Black-Bellied Seedcracker  
Finch *Pyrenestes ostrinus* 118
- 5.16 The Beak Polymorphism in the Darwin Finch *Geospiza fortis* 119
- 5.17 Intraspecies Morphs in the Garter Snake *Thamnophis ordinoides* 121
- 5.18 Urbanization in Certain Bird Species is based on Genetic  
Polymorphism 121
- 5.19 The Mimicry Morphs of the Female Swallowtails  
of the Genus *Papilio* 123
- 5.20 The Morphs of the Brood-Parasitic Cuckoo Female  
*Cuculus canorus* 125
- 6 Biological Species as a Gene-Flow Community 127**
- 6.1 The Definition of the Gene-Flow Community 127
- 6.2 The Connection of Organisms in a Gene-Flow Community  
Includes the Genealogical Connection 130
- 6.3 The Species is a Gene-Flow Community, Not a Reproductive  
Community 131
- 6.4 A Species Concept Requires Both Connection and Delimitation 133
- 6.5 The Concept of the Gene-Flow Community in Eukaryotes  
and in Bacteria 134
- 6.6 Uniparental Propagation in Eukaryotes 135
- 6.7 Why do the Individuals of a Species Resemble Each Other? 138
- 6.8 Isolation by Distance 140
- 6.9 A Decrease in Lateral Sexual Gene Flow, together with Local  
Adaptation, Creates Races 141
- 6.10 The Adaptation of Breeding Times in Birds to the Annual  
Maximum Food Supply 143
- 6.11 Are Migratory and Sedentary Birds Able to Crossbreed? 144

- 6.12 Are Geographically Distant Populations of Stonechats (*Saxicola torquata*) or Blackcaps (*Sylvia atricapilla*) Genetically Compatible? 146
- 6.13 Are Univoltine and Bivoltine Butterflies Able to Crossbreed? 148
- 6.14 Speciation Genes, Pre- and Postzygotic Barriers 149
- 6.15 Hybrid Incompatibility 151
- 6.16 Haldane's Rule and the Genes for Postzygotic Incompatibility 153
- 6.17 Sympatric and Allopatric Speciation 155
- 6.18 Sympatric Speciation in the Fruit fly *Rhagoletis*, in Cichlids and in the Fire Salamander 159
- 6.19 Reproductive Incompatibility is Different than Phylogenetic Distance 161
- 6.20 Phylogenetic Distance and Reproductive Incompatibility in Two Species Pairs, Polar Bear (*Ursus maritimus*) and Brown Bear (*U. arctos*), in Comparison to Grey Wolf (*Canis lupus*) and Coyote (*C. latrans*) 162
- 6.21 The Herring Gull (*Larus argentatus*) and the Greenish Warbler (*Phylloscopus trochiloides*), a False and a True Model for the Ring Species 163
- 6.22 Allopatrically Separated Populations are Always Different Species 165
- 6.23 Species Hybrids as Exceptions without Evolutionary Consequences 167
- 6.24 The Example of Some Duck Species: Extinction through Hybridization 169
- 6.25 The Origin of Reproductive Isolation Through Reinforcement 171
- 6.26 Hybridogenic Speciation 173
- 6.27 Is the Italian Sparrow (*Passer italiae*) a Hybrid Species? 176
- 6.28 "Gene theft" between two Species of Galapagos Ground Finches 178
- 6.29 "Gene theft" between two Species of Green Frogs (*Pelophylax ridibunda* and *P. lessonae*) 180
- 6.30 How many Genes Must Mutate for the Origin of New Species? 181
- 6.31 The Problem of Smooth Boundaries between two Gene-Flow Communities 183
- 7 The Cohesion of Organisms Through Genealogical Lineage (Cladistics) 187**
- 7.1 Preliminary Remarks on Descent Connection 187
- 7.2 The Problem of Displaying the Phylogenetic Tree in the Case of Biparental Reproduction 189
- 7.3 What are Species Boundaries in Cladistics? 191
- 7.4 How is a Cladistic Bifurcation Defined? Apomorphies and Autapomorphies 194
- 7.5 Descent is not the Same Thing as Kinship: The Concepts of Monophyly and Paraphyly 196
- 7.6 Why are Paraphyla used Despite their Inconsistency? 199
- 7.7 Monophyly and Paraphyly on Different Hierarchical Levels 202

|          |                                                                                      |            |
|----------|--------------------------------------------------------------------------------------|------------|
| 7.8      | Gene Trees are not Species Trees                                                     | 204        |
| 7.9      | The Concepts of Monophyly and Paraphyly cannot be Applied to Species                 | 206        |
| 7.10     | Paraphyly and Anagenesis are Mixed Classifications                                   | 208        |
| 7.11     | The Cladistic Bifurcation of a Stem Species Always Means the End of the Stem Species | 210        |
| 7.12     | The “Phylocode”                                                                      | 212        |
| <b>8</b> | <b>Outlook</b>                                                                       | <b>217</b> |
|          | <b>References</b>                                                                    | <b>219</b> |
|          | <b>Scientific Terms</b>                                                              | <b>229</b> |
|          | <b>Index</b>                                                                         | <b>239</b> |
