Index

a

active matrix spatial light modulator (AMSLM) 43
adaptive networks
– chemical triggering 24
– light-induced logic operations 25–28
– light triggering 24–25
algorithmic assembly, via DNA lattices 206
– error correction schemes for tilings 207–209
– error sources 206–207
AND logic 15, 26, 62, *63*, 64, *65*, 67, 68, *71*, 270–271
antibody encryption and steganography 108–112
approximation simulation 318–319
aptamers 118
– biocomputing 121–124
aqueous computing 245, 255–260
asymmetric structure *241*
atomic force microscopy (AFM) 214

b

bacteriorhodopsin 33, 38
– genetic engineering, for device applications 51–53
– as photonic and holographic materials for bioelectronics 40
– – branched photocycle 42
– – light-induced photocycle 40–42
bio-barcode 113–114
biocatalyst 107 113, *127*
– cascade, 103–104, *106*, 108m *109*
– keypad lock 107
– oxidation *111*
biochemical model, for heat shock response 332–334
biocomputing 61, 62, 69–71, 75, 77, 81, 82, *83*, 85, 88, 89–94, 97, 98, 117, 265, 348, *349*. *See also individual entries*
– aptamer 121–124
– DNA 119–121
– enzyme 124–128
bioelectronic devices 61–62
– biomolecular logic systems 70–74
– enzyme-based logic systems
– – with electrodes modified with signal-responsive polymers 64–68
– – injury biomarkers processing by 74–77
– – producing pH changes as output signals 62–64
– – switchable biofuel cells controlled by 68–69
biofuel cells 107, *108*, *109*, 121–123, 125, 126
– switchable 68–69, *124*
biological networks
– building models for 281–283
– translation into logic circuits 286–287
biomedical application. *See individual entries*
biomolecular computing systems 1–5, 199, *348*. *See also* biocomputing
– biochemical DNA reaction networks 217–218
– design and programmability ease of 220
– DNA 200
– – computing 203–205
– – reaction review 200–203
– – structure 200
– – tiles 205–209
– experimental advances
– – in enzyme-based DNA computing 212–217
– – in purely hybridization-based computation 209–212

Biomolecular Information Processing: From Logic Systems to Smart Sensors and Actuators,
First Edition. Edited by Evgeny Katz.
© 2012 Wiley-VCH Verlag GmbH & Co. KGaA. Published 2012 by Wiley-VCH Verlag GmbH & Co. KGaA.

biomolecular computing systems (*contd.*)
– *in vitro* 220
– scalability 218–220
biomolecular electronics and protein-based optical computing 33
– bacteriorhodopsin as photonic and holographic materials for bioelectronics 40
– – branched photocycle 42
– – light-induced photocycle 40–42
– bacteriorhodopsin genetic engineering, for device applications 51–53
– Fourier Transform holographic associative processors 42–45
– semiconductor electronics 34
– – architecture 36–37
– – nanoscale engineering 37
– – reliability 38–40
– – size and speed 34–36
– – stability 38
– three-dimensional optical memories 45–46
– – efficient algorithms for data processing 48–50
– – multiplexing and error analysis 50–51
– – write, read, and erase operations 46–48
biomolecular finite automata 145–146
– developmental biology applications 172–176
– DNA-based automaton with bacterial phenotype output 161–163
– first realization of autonomous DNA-based 150–155
– molecular computing device for medical diagnosis and treatment *in vitro* 159–161
– molecular computing with plant cell phenotype 163–167
– molecular cryptosystem for images by DNA computing 157–159
– molecular Turing machine theoretical models 146–150
– three-symbol-three-state DNA-based 155–157
– transducer 167–172
biomolecular logic 3
– systems 70–74
biomolecule computing 260–261
biosensors 61, 64, 74, 77, 119, 123, 124, 129, 275. *See also* enzyme logic digital biosensors
Boolean analysis, of regulatory networks 285–286
– biological networks translation into logic circuits 286–287
– from digital networks to workable models 288–289
– regulatory and metabolic logic integration in same Boolean circuit 287–288
Boolean logic 117, 119, 121–125, 128. *See also individual entries*
Boolean satisfiability problem (SAT) 253
Broken Lego Property 17

c

cellular computing circuits development, bacteria-based 265, *266*
– genetic toolbox
– – engineered gene regulation 267–269
– – quorum sensing 269
– implementations
– – AND logic gates 270–271
– – complex logic functions with multiple strains 272–273
– – edge detector 271–272
– – oscillators 269–270
– – switches 270
– transition from enzyme computing to bacteria-based computing 274–276
– transition to *in silico* rational design 273–274
charge-coupled detector (CCD) 43, 48
chemical logic gates 9, 28. *See also* peptide-based computations
chemical reaction networks (CRNs) 217
circular DNA molecules 248–249
convolution-based parallel machine (CONV-PAR) 49–50
cooperative binding errors 206

d

data refinement 331
decision making, in environmental bacteria 279–281
– biological networks, building models for 281–283
– Boolean analysis of regulatory networks 285–286
– – biological networks translation into logic circuits 286–287
– – from digital networks to workable models 288–289
– – regulatory and metabolic logic integration in same Boolean circuit 287–288
– Boolean description of m-xylene 289–291
– – 3MB 296
– – Ps–Pr regulatory node deconstruction into three autonomous logic units 292, 294

– – regulatory events formalization at upper and lower TOL operons 294–296
– – TOL logicome 296–298
– – TOL regulatory circuit narrative description 291–292
– regulatory networks formulation and simulation 283–284
– – graphical models 285
– – stochastic versus deterministic models 284–285
deoxyribozyme 133–134, *135*, *136*, 202, 217
developmental biology applications and biomolecular finite automata 172–176
directed evolution 37, 52, *53*
directed self-assembly 209
disjunctive normal form (DNF) 185, 187–188, *191*
DNA 200
– -based automaton, with bacterial phenotype output 161–163
– -based finite automaton, first realization of autonomous 150–155
– biocomputing 119–121
– circular molecules 248–249
– computing 3, 119–121, 246–251, 253–254, 255, 257, 259, 260–261, 347
– – challenges 218–220
– – experimental advances in enzyme-based 212–217
– – Hamiltonian path problem via 204
– – models 204
– – molecular cryptosystem for images by 157–159
– – NP-complete problems 203
– – shortcomings and nonscalability if schemes using 204–205
– ligation 202
– polymerase 202
– reaction networks, biochemical 217–218
– reactions review 200–203
– structure 200
– tiles 205
– – algorithmic assembly via lattices 206–209
– – TAM 205–206
DNAzymes 2
dry splicing systems 249–252
dynamic programming (DP) 225

e

electronic computing 347, 348
ELISA plate 110, 112
encryption 104, 106, 111–114
endonucleases 202
enumeration approach, to interacting nucleic acid strands analysis 225–226
– chemical equilibrium and hybridization reaction system 227–229
– set and multiset definitions and notations 226–227
– symmetric enumeration method 230
– – associated weight functions 241–242
– – basic notations 237–239
– – complexity issues 242–243
– – convex programming problem for computing equilibrium 235–236
– – enumeration graph 230, 239–241
– – enumeration scheme 232–235
– – path mappings 231–232
– – symmetric properties 242
– – target secondary structures 237
enzyme-based logic systems. *See* bioelectronic devices
enzyme biocomputing 124–128. *See also individual entries*
enzyme logic digital biosensors 81–82
– filter systems application 94–96
– injury codes multiplexing for parallel operation of enzyme logic gates 85–89
– for injury conditions identifications 82–85
– mimicking biochemical pathways 89–94
equilibrium equation 228
equilibrium state 228, 229
Escherichia coli 265, 268, 269, 270, 272–273, 280, 282, 287, 326
exonucleases 202, 216
experimental logic gates 21
– additional logic operations 23
– NOT, NOR, and NOTIF logic 21, 23
– OR logic 21

f

feedback and feed forward loops (FFLs) 280, 286
feedback mechanism 326
feed-forward loop (FFL) 20–21
finite automaton 150–155, 252
fluid memory 254–255
Fourier Transform holographic associative processors 42–45
free-energy minimization problem (FEMP) 225, 235–236

g

gene expression 183, 184, 191, 195
genetic engineering 37
– bacteriorhodopsin, for device applications 51–53

genetic regulatory network 307, *308*
graphical models 285

h

Halobacterium salinarum 33, 40
heat shock response
– biochemical model for 332–334
– pathway identification for phosphorylation-driven control of 341–342
human–computer interface 348, *349*
hybridization reaction system (HRS) 226, 228–229, 230, 236

i

information security applications 103–104
– antibody encryption and steganography 108–112
– bio-barcode 113–114
– molecular and bio-molecular keypad locks 104–108
initial distribution 228
intelligent logic detection *See* biocomputing
in vivo information processing
– computational core experimental confirmation 188–189
– computation versus computer 182
– regulatory pathways as computations 181
– RNA interference-based logic 183–184
– – logic circuit blueprint 184–188
– sensory module building 189–190
– – complex transcriptional regulation using RNAi-based circuits 194–195
– – siRNA direct control, by mRNA inputs 191–194
– synthetic biomolecular computing circuits, prior work on 182–183

k

keypad locks 104–108
kinetic tile assembly model (kTAM) 206

l

Langmuir-Blodgett technique 37
Latin hypercube sampling method (LHS) 337–338
living cell functioning, model for processes inspired by 303–304
– examples 307–310
– gene expression systems approximations 316–317
– quantitative model, generic 315–316
– reactions 304–305
– – generalized 312–315
– reaction systems 305–307
– – with measurements 310–312
– – simulating approximations by 318–319
logic gates 2, 61, 62, *65*, 66, 68, 73–75, 82, 85–89, *91*, *94*, 97, 103–104, 107, 133, 134, *136*, 137, 281, 286–287, *293*, *295*, 299. *See also individual entries*
– biochemical *63*
– construction
– – RNA quasispecies replication 17–19
– – symmetry and order in peptide-based catalytic networks 16–17
– within ternary networks
– – AND logic 15
– – NAND logic 15
– – OR logic 14–15
– – uniform design principles of two-input gates 13–14
– – XOR logic 15–16
logic network 81, 89, 90
Lotka–Volterra chemical oscillator CRN, using DNA 218

m

MAYAs 134, 136, 137, *138*, 139
measurement function 311, 312, 314, 315, 319
metabolic networks 281
mitogen-activated protein (MAP) kinase 126
molecular and bio-molecular keypad locks 104–108
molecular computing 182, 191, 194, 195
– device, for medical diagnosis and treatment *in vitro* 159–161
– with plant cell phenotype 163–167
– and robotics 133
– – gates and programmable automata 133–139
– – random walker and molecular robotics 139–142
molecular networks 9, 13, 17, 24. *See also* peptide-based computations
molecular programming, DNA as tool for 200
– DNA reaction review 200–203
– DNA structure 200
molecular spiders 140
m-xylene Boolean description 289–291
– Ps–Pr regulatory node deconstruction into three autonomous logic units 292, 294
– regulatory events formalization at upper and lower TOL operons 294–296
– – 3MB 296
– TOL logicome 296–298

– TOL regulatory circuit narrative description 291–292

n

NAND logic 15, 26, 122
nanomedicine 348
natural computing 303
network motifs 20–21
NOR logic 21, 73
NOTIF logic 21, 23
NOT logic 21
nucleases 202
nucleotides 200

o

ordinary differential equations 284
OR logic 14–15, 21, *63*, 64, *65*, 67, 68, *71*, *74*, *75*

p

peptide-based computations 9–10
– adaptive networks
– – chemical triggering 24
– – light-induced logic operations 25–28
– – light triggering 24–25
– arithmetic units 19–20
– experimental logic gates 21
– – additional logic operations 23
– – NOT, NOR, and NOTIF logic 21, 23
– – OR logic 21
– logic gates construction
– – RNA quasispecies replication 17–19
– – symmetry and order in peptide-based catalytic networks 16–17
– logic gates within ternary networks
– – AND logic 15
– – NAND logic 15
– – OR logic 14–15
– – uniform design principles of two-input gates 13–14
– – XOR logic 15–16
– network motifs 20–21
– replication networks
– – *de novo* designed synthetic networks 12–13
– – network connectivity theoretical prediction 11–12
– – template-assisted replication 10–11
– switches and gates for molecular electronics 28–29
photocycle 40
plasmids, computing with 253–254
process refinement 331
Pseudomonas aeruginosa 275, 276
Pseudomonas putida 281, 283, 289
purple membrane 40

q

quantitative submodel comparison computational methods 323–324
– case study
– – biochemical model for heat shock response 332–334
– – control-based decomposition 334–335
– – knockdown mutants and local comparison 335–337
– – parameter-independent comparison of mutant behavior 337–341
– – pathway identification for phosphorylation-driven control of heat shock response 341–342
– methods 327
– – local submodel comparison 329
– – mathematically controlled model comparison and extension 327–329
– – model comparison for pathway identification 332
– – parameter-independent submodel comparison 331–332
– – quantitative measure for goodness of model fit against experimental data 329–330
– – quantitative refinement 330–331
– model decomposition methods 324
– – control-based decomposition 325–326
– – elementary flux modes 325
– – knockdown mutants 324–325
quorum sensing 269

r

random mutagenesis (RM) 52
regulatory networks
– Boolean analysis of 285–286
– – biological networks translation into logic circuits 286–287
– – from digital networks to workable models 288–289
– – regulatory and metabolic logic integration in same Boolean circuit 287–288
– formulation and simulation 283–284
– – graphical models 285
– – stochastic versus deterministic models 284–285
replication networks, peptide-based
– *de novo* designed synthetic networks 12–13
– network connectivity theoretical prediction 11–12
– template-assisted replication 10–11

restriction enzymes, in language generation 245–246
– aqueous computations 255–260
– biomolecule computing 260–261
– dry splicing systems 249–252
– fluid memory 254–255
– plasmids, computing with 253–254
– splicing theory 252–253
– wet splicing systems 246–249
RNA interference-based logic 183–184
– complex transcriptional regulation using RNAi-based circuits 194–195
– logic circuit blueprint 184–188
RNA quasispecies replication 17–19
robotics, molecular 139–142

s

secondary structures 233, 237
seesaw gates 209–212
self power 123, 125, 126, *127*, 128–129
self-replication 11, 17
semiconductor electronics and molecular electronics 34
– architecture 36–37
– nanoscale engineering 37
– reliability 38–40
– size and speed 34–36
– stability 38
semi-random mutagenesis (SRM) 52
sensory module building 189–190
– complex transcriptional regulation using RNAi-based circuits 194–195
– siRNA direct control, by mRNA inputs 191–194
siRNA direct control, by mRNA inputs 191–194
site-directed mutagenesis (SDM) 52
site-specific saturation mutagenesis (SSSM) 52
snaked-proofreading technique 207–208, *209*
spatial computation 138–139
splicing language 246
– consisting of 10 molecular varieties 246–247
– infinite 247–249
splicing system 245
splicing theory 252–253
S-systems 327
steganography 108–112, *111*
sticker-based methods 204
stochastic versus deterministic models 284–285
strand displacement 200–201, *201*, 209, 213, 217
switches and gates, for molecular electronics 28–29
symmetric enumeration method (SEM) 226, 230
– application to nucleic acid strands interaction
– – associated weight functions 241–242
– – basic notations 237–239
– – complexity issues 242–243
– – enumeration graph structure definition 239–241
– – symmetric properties 242
– – target secondary structures 237
– convex programming problem for computing equilibrium 235–236
– enumeration graph 230
– enumeration scheme 232–235
– path mappings 231–232
symmetric structure *241*
synthetic biology 281, 299
synthetic biomolecular computing circuits, prior work on 182–183
synthetic networks, *de novo* designed 12–13

t

TAM model 205–206
template-assisted replication 10–11
test tube model 204
three-dimensional optical memories 45–46
– efficient algorithms for data processing 48–50
– multiplexing and error analysis 50–51
– write, read, and erase operations 46–48
three-symbol-three-state DNA-based automata 155–157
threshold inequalities 289
tiles, DNA 205
– algorithmic assembly via lattices 206–209
– TAM 205–206
TOL logicome 289–298
transcriptional regulation, complex
– using RNAi-based circuits 194–195
transcription factors 183, 194–195, 279, 281, 282–283, 287–288
transducer, biomolecular finite 167–172
transition molecules (TMs) 148, 152, 158
transition system 307, 309–310
Turing machine theoretical models, molecular 146–150

u
unconventional computing *See* restriction enzymes, in language generation

v
Vibrio fischeri 269

w
wet algorithm 245. *See also* splicing language
whiplash PCR 212
whole cells 267

x
XOR logic 15–16
