acquisition reform 395
active electronic components packaging
  blends 394–395
  – adhesives 398–399
  – molding material 396–398
aerospace adhesive applications 339–340
aliphatic polyesters 257
amine-terminated butadiene acrylonitrile
  (ATBN) 45–46, 275–276, 283
applications 339, 343–344
  – aerospace adhesive applications 339–340
  – composites 341–342
  – epoxy resin modification 342–343
  – nanoparticle modification 343
  – rubber-modified resins 340–341
  – thermoplastic modification 343
  – thermostet-based materials for optical
    applications containing azobenzene
    chromophores 344–345
    – epoxy-based networks 345–349
    – photoreactable networks containing
      alkyl compounds 354–358
    – urethane-based networks 349–354
atomic force microscopy (AFM) 56, 153–156, 166
autocatalytic model 113
  – model parameters determination 113–115

b
B/D approach 110
Bailleul model 117
block copolymers as modifiers 16
Bragg’s law 241
c
Cahn–Hilliard model 243
carbon nanotubes (CNTs) 307, 309, 401, 412
carboxyl-terminated polybutadiene (CTPB)
  320–321, 331
carboxyl-terminated
  poly(butadiene-co-acrylonitrile (CTBN)
Coats–Redfern (CR) method 300
combinatorial entropy 128
conductivity 310–311
confining-fluid technique 184–185
core–shell particles 14
core–shell rubber-modified epoxies 224,
  226–227
crack pinning 22
crazing 19–21
creep 413–414
creep tests 400
critical point 129
cure analysis 83–84
cured materials viscoelasticity
  – dielectric measurement 231–233
  – dynamic mechanical study 228–231
cure reactions 1–2
curing agents 2
  – catalytic cure 3
  – co-reactive cure 3
  – acid anhydrides 5–7
  – carboxylic acids 5
  – isocyanates 5
  – mercaptans 5
  – primary and secondary amines 3–4
curing kinetics 84
  – activation energies 86
  – dynamic methods 86–87
  – isothermal methods 87
  – analysis 85
  – autocatalytic model 85
curing kinetics (contd.)
  – dielectric spectroscopy thermal method 94–96
  – differential scanning calorimetry (DSC) 88
    – dynamic 89–90
    – isothermal 90–92
  – dynamic mechanical analysis (DMA) and rheological methods 97–100
  – Fourier transform infrared (FTIR) spectroscopy 92–93
  – pressure–volume–temperature (PVT) method 96–97

Curing kinetics modeling 106–107
  – mechanistic approach 107–109
  – phenomenological models describing reaction 109–117
  – rheological models 118–119
  – vitrification effect on reaction rate 119–121

Curing methods 7
  – microwave curing
  – radiation curing
    – electron beam curing 10
    – gamma ray irradiation 8–12
    – thermal curing 7–8
  – curing process theoretical modeling 105
  – curing kinetics modeling 106–107
    – mechanistic approach 107–109
    – phenomenological models describing reaction 109–117
    – rheological models 118–119
    – vitrification effect on reaction rate 119–121
  – empirical models application 120, 122

Curometer 206

Debye–Bueche theory 252
dielectric constant 306–308, 311
dielectric spectroscopy thermal method 94–96
  – dynamic 89–90
  – isothermal 90–92
diffusion factor 88
diglycidyl ether of bisphenol-A epoxy resin (DGEBA) 316–320
 dispersion process 17
dry-brush “wet-brush” model 61–63
dynamic (constant heating rate) methods 110
dynamic mechanical analysis (DMA) and rheological methods 97–100
dynamic scanning curing process 113–115

elastomeric modified epoxies dielectric properties 305–306
  – combined studies on dielectric constant
    volume resistivity, and conductivity, 311
  – conductivity 310
  – dielectric constant 306–308
  – volume resistivity 308–310
elastomer-modified epoxy resins 18
  – cavitation and rumples 22–23
  – crack pinning 22
  – crazing 20–21
  – particle deformation 18–19
  – shear yielding 19–20
  – simultaneous shear yielding and crazing 21–22
electrically conductive adhesives 415
epoxy-based networks 345–349

failure analysis 396, 405
  – methods 405–409
  – self-healing 416–417
  – typical failure modes and mechanisms used
    in micro and nanotechnologies 405
  – ion contamination 414–416
  – mechanical damages 409–414
fiber-reinforced polymer (FRP) 400
flash method 294
Flory–Huggins approximation 242
Flory–Huggins model 64
Flynn–Wall–Ozawa method 86
Fourier’s law 292
Fourier transform infrared (FTIR) spectroscopy 79, 92–93, 307, 316
  – and Raman spectroscopy 316, 320–322
  – DGEBA epoxy/rubber blends 316–320
  – imaging 322–323
Fox’s theory 204
Fractography. See fracture
fracture 409–413
fracture energy 24
fracture toughness 65–66, 281–282
  – concentration effect 282–284
  – curing agent effect 285
  – strain rate effect 284–285
Furukawa scaling theory 132

gel permeation chromatography (GPC) 84
gel time model 118
GLARE 341–342
glass transition temperature 67
Gnomix apparatus 185
guarded hot plate method 292

h
Highly Accelerated Stress Test (HAST) 396
high-pressure liquid chromatography (HPLC) 108
high voltage direct current (HVDC) 308
hot disk method. See transient plane source
hot wire method 293–294
hydroxyl terminated polybutadiene (HTPB) 317, 319, 326–329, 333, 410
hygrothermal toughening agents 14
hyperbranched polymer blends development
and properties 375–378
and rubbers as tougheners 383–387

i
interfacial adhesion 18
inverse estimation method 296
ion contamination 414–416
isoconversional method principle 111–112
isothermal curing methodology 113
isothermal method 110
isotropic polymers 255

Kamal and Sourour model 115–116
Kerner equation 281
Kissinger equation 111

l
life cycle assessment (LCA) 421–422
– in aerospace application 429–430
– analysis of epoxy resin containing carbon
nanotubes 426
– in automotive application 428
– of epoxy resins produced based on
propylene and glycerin 424–426
– natural fiber-reinforced epoxy composites
430
– of novel hybrid glass-hemp and thermoset
composite 430
– significance 422
– goal and scope definition 422–423
– impact assessment 423–424
– inventory analysis 423
– result interpretation 424
– of wind turbine blade materials 426–428
light scattering experiment 242–250
liquid elastomers for toughening matrices
13–14
liquid-filled urea-formaldehyde 416
liquid molding technologies novel toughening
approaches 378–382
liquid rubber blends manufacture 73
– comparison of hardeners 74–77
– cure reaction analysis 79
– rubber-toughened epoxy resins 77–79
liquid-rubber-modified epoxies 224
– core–shell rubber-modified epoxies 224,
226
– ternary systems with fillers 228
liquid toughening rubber
– fracture behavior of thermosets 32–35
– natural rubbers 35–36
– preparation method 36–42
– in thermoset resins 31–32, 43–49

m
Maxwell-type equation 244
Maxwell–Wagner–Sillars polarization 94
mechanical damages
– creep 413–414
– fracture 409–413
mechanical properties 271–272
– fracture toughness 281–282
– concentration effect 282–284
– curing agent effect 285
– strain rate effect 284–285
– of rubber-modified epoxies 272–273
– acrylonitrile content influence 279–280
– curing agent influence 278–279
– initial cure temperature influence
276–277
– Kerner equation 281
– rubber concentration influence 273–276
– strain rate influence 280
micro/nanotechnologies and reliability testing
392–394
miscibility and phase behavior studies in
polymer blends 239–240
– light scattering experiment 242–250
– neutron scattering
– small-angle neutron scattering (SANS)
261–266
– scattering theoretical considerations
240–242
– X-ray scattering 250–260
modulated DSC 295
molding compounds (MCs) 415, 416
morphology analysis by microscopy
techniques and light scattering 147
– developments in rubber-modified epoxies
147–148
– atomic force microscopy (AFM)
153–156, 166
morphology analysis by microscopy techniques and light scattering (cont.)

- optical microscopy (OM) 148–150
- scanning electron microscopy (SEM) 150–153
- small-angle light scattering (SALS) 159
- transmission electron microscopy (TEM) 155–159

- toughening morphology and reinforcing effects 165
- conventional additives 165–167
- hyperbranched polymers 167–171
- types 160
- homogeneous morphology 163–165
- hybrids morphology 161–163
- phase-separation morphology 160–161
