	Preface	<i>xiii</i>
1	Introduction – Studying Systems from Two Viewpoints	1
2	Classical Mechanics and Numerical Methods	5
2.1	Mechanics – The Study of Motion	5
2.2	Classical Newtonian Mechanics	6
2.3	Analytical Solutions of Newton’s Equations and Phase Space	8
2.3.1	Motion of an Object Under Constant Gravitational Force	8
2.3.2	One-Dimensional Harmonic Oscillator	10
2.3.3	Radial Force Functions in Three Dimensions	12
2.3.4	Motion Under the Influence of a Drag Force	15
2.4	Numerical Solution of Newton’s Equations: The Euler Method	17
2.5	More Efficient Numerical Algorithms for Solving Newton’s Equations	20
2.5.1	The Verlet Algorithm	20
2.5.2	The Leapfrog Algorithm	21
2.5.3	The Velocity Verlet Algorithm	22
2.5.4	Considerations for Numerical Solution of the Equations of Motion	23
2.6	Examples of Using Numerical Methods for Solving Newton’s Equations of Motion	25
2.6.1	Motion Near the Earth’s Surface Under Constant Gravitational Force	25
2.6.2	One-Dimensional Harmonic Oscillator	26
2.7	Numerical Solution of the Equations of Motion for Many-Atom Systems	28
2.8	The Lagrangian and Hamiltonian Formulations of Classical Mechanics	29
	Chapter 2 Appendices	32
2.A.1	Separation of Motion in Two-Particle Systems with Radial Forces	32
2.A.2	Motion Under Spherically Symmetric Forces	33
3	Intra- and Intermolecular Potentials in Simulations	39
3.1	Introduction – Electrostatic Forces Between Atoms	39
3.2	Quantum Mechanics and Molecular Interactions	40

3.2.1	The Schrödinger Equation	40
3.2.2	The Born–Oppenheimer Approximation	42
3.3	Classical Intramolecular Potential Energy Functions from Quantum Mechanics	44
3.3.1	Intramolecular Potentials	45
3.3.2	Bond Stretch Potentials	48
3.3.3	Angle Bending Potentials	51
3.3.4	Torsional Potentials	51
3.3.5	The 1–4, 1–5, and Farther Intramolecular Interactions	53
3.4	Intermolecular Potential Energies	54
3.4.1	Electrostatic Interactions	54
3.4.1.1	The Point Charge Approximation	55
3.4.1.2	The Multipole Description of Charge Distribution	59
3.4.1.3	Polarizability	61
3.4.2	van der Waals Interactions	63
3.5	Force Fields	64
3.5.1	Water Force Fields	64
3.5.2	The AMBER Force Field	66
3.5.3	The OPLS Force Field	68
3.5.4	The CHARMM Force Field	69
3.5.5	Other Force Fields	69
	Chapter 3 Appendices	71
3.A.1	The Born–Oppenheimer Approximation to Determine the Nuclear Schrödinger Equation	71
4	The Mechanics of Molecular Dynamics	73
4.1	Introduction	73
4.2	Simulation Cell Vectors	73
4.3	Simulation Cell Boundary Conditions	75
4.4	Short-Range Intermolecular Potentials	79
4.4.1	Cutoff Radius and the Minimum Image Convention	79
4.4.2	Neighbor Lists	82
4.5	Long-Range Intermolecular Potentials: Ewald Sums	84
4.6	Simulating Rigid Molecules	88
	Chapter 4 Appendices	92
4.A.1	Fourier Transform of Gaussian and Error Functions	92
4.A.2	Electrostatic Force Expression from the Ewald Summation Technique	94
4.A.3	The Method of Lagrange Undetermined Multipliers	95
4.A.4	Lagrangian Multiplier for Constrained Dynamics	98
5	Probability Theory and Molecular Simulations	101
5.1	Introduction: Deterministic and Stochastic Processes	101
5.2	Single Variable Probability Distributions	103
5.2.1	Discrete Stochastic Variables	103
5.2.2	Continuous Stochastic Variables	104
5.3	Multivariable Distributions: Independent Variables and Convolution	106

5.4	The Maxwell–Boltzmann Velocity Distribution	111
5.4.1	The Concept of Temperature from the Mechanical Analysis of an Ideal Gas	112
5.4.2	The Maxwell–Boltzmann Distribution of Velocities for an Ideal Gas	115
5.4.3	Energy Distributions for Collections of Molecules in an Ideal Gas	120
5.4.4	Generating Initial Velocities in Molecular Simulations	123
5.5	Phase Space Description of an Ideal Gas	125
	Chapter 5 Appendices	127
5.A.1	Normalization, Mean, and Standard Deviation of the Gaussian Function	127
5.A.2	Convolution of Gaussian Functions	128
5.A.3	The Virial Equation and the Microscopic Mechanical View of Pressure	131
5.A.4	Useful Mathematical Relations and Integral Formulas	133
5.A.4.1	Stirling’s Approximation for $N!$	133
5.A.4.2	Exponential Integrals	134
5.A.4.3	Gaussian Integrals	134
5.A.4.4	Beta Function Integrals	134
5.A.5	Energy Distribution for Three Molecules	135
5.A.6	Deriving the Box–Muller Formula for Generating a Gaussian Distribution	136
6	Statistical Mechanics in Molecular Simulations	139
6.1	Introduction	139
6.2	Discrete States in Quantum Mechanical Systems	140
6.3	Distributions of a System Among Discrete Energy States	142
6.4	Systems with Non-interacting Molecules: The μ -Space Approach	145
6.5	Interacting Systems and Ensembles: The γ -Space Approach and the Canonical Ensemble	148
6.5.1	Thermodynamics Quantities	152
6.5.2	Fluctuations in Thermodynamic Quantities in the Canonical Ensemble	154
6.5.3	Canonical Ensemble for Systems with Non-interacting Molecules	156
6.5.4	A Physical Interpretation of the Canonical Partition Function	157
6.6	Other Constraints Coupling the System to the Environment	158
6.6.1	Isothermal–Isobaric Ensemble (Fixed N , P , and T)	158
6.6.2	Grand Canonical Ensemble (Fixed μ , V , and T)	163
6.6.3	Microcanonical Ensemble (Fixed N , V , and E)	166
6.6.4	Isenthalpic–Isobaric Ensemble (Fixed N , P , and H)	167
6.7	Classical Statistical Mechanics	167
6.7.1	The Canonical Ensemble	167
6.7.2	The Isothermal–Isobaric Ensemble	169
6.7.3	The Grand Canonical Ensemble	169
6.7.4	The Microcanonical Ensemble	170
6.7.5	Isenthalpic–Isobaric Ensemble	170
6.8	Statistical Mechanics and Molecular Simulations	171

	Chapter 6 Appendices	172
6.A.1	Quantum Mechanical Description and Determination of the Lagrange Multiplier β and Pressure for an Ideal Gas	172
6.A.2	Determination of the Lagrange Multiplier β in Systems with Interacting Molecules	174
6.A.3	Summary of Statistical Mechanical Formulas	175
7	Thermostats and Barostats	177
7.1	Introduction	177
7.2	Constant Pressure Molecular Dynamics (the Isobaric Ensembles)	178
7.2.1	Non-isotropic Volume Variation: The Parrinello–Rahman Method	184
7.3	Constant Temperature Molecular Dynamics	185
7.3.1	Extended System Method: The Nosé–Hoover Thermostat	185
7.3.2	The Berendsen Thermostat	190
7.4	Combined Constant Temperature–Constant Pressure Molecular Dynamics	192
7.5	Scope of Molecular Simulations with Thermostats and Barostats	195
	Chapter 7 Appendices	196
7.A.1	Andersen Barostat and the Isobaric–Isenthalpic Ensemble	196
7.A.2	The Lagrangian for a Constant Pressure System with Non-isotropic Volume Change: The Parrinello–Rahman Method	196
7.A.3	Nosé Thermostat System and the Canonical Ensemble Distribution Function	197
8	Simulations of Structural and Thermodynamic Properties	199
8.1	Introduction	199
8.2	Simulations of Solids, Liquids, and Gases	200
8.2.1	Setting Up Initial Structures for Molecular Simulations of Solids, Liquids, and Gases	202
8.3	The Radial Distribution Function	205
8.4	Simulations of Solutions	211
8.5	Simulations of Biological Molecules	214
8.6	Simulation of Surface Tension	219
8.7	Structural Order Parameters	224
8.8	Statistical Mechanics and the Radial Distribution Function	227
8.9	Long-Range (Tail) Corrections to the Potential	232
	Chapter 8 Appendices	233
8.A.1	Force Fields for Simulations in the Figures of Chapter 8	233
8.A.1.1	Nitrogen Force Field	233
8.A.1.2	NaCl Simulation Force Field	233
8.A.2	The PDB File Format	234
9	Simulations of Dynamic Properties	237
9.1	Introduction	237
9.2	Molecular Motions and the Mean Square Displacement	237
9.2.1	Motion in Bulk Phases	237

9.2.2	Motion in Confined Spaces and on Surfaces	244
9.3	Molecular Velocities and Time Correlation Functions	247
9.3.1	Collisions and the Velocity Autocorrelation Function	247
9.3.2	Time Correlation Functions for Stationary Systems	251
9.4	Orientation Autocorrelation Functions	251
9.5	Hydrogen Bonding Dynamics	253
9.6	Molecular Motions on Nanoparticles: The Lindemann Index	254
9.7	Microscopic Determination of Transport Coefficients	256
9.7.1	The Transport Coefficients	256
9.7.2	Nonequilibrium Molecular Dynamics Simulations of Transport Coefficients	261
9.7.3	The Green–Kubo Relations and Simulation of Transport Coefficients	261
	Chapter 9 Appendices	263
9.A.1	Brownian Motion and the Langevin Equation	263
9.A.2	The Discrete Random Walk Model of Diffusion	265
9.A.3	The Solution of the Diffusion Equation	267
9.A.4	Relation Between Mean Square Displacement and Diffusion Coefficient	268
10	Monte Carlo Simulations	269
10.1	Introduction	269
10.2	The Canonical Monte Carlo Procedure	270
10.2.1.1	Determining Which Molecule to Move	273
10.2.1.2	Determining Whether a Translation or Rotation Is Performed	273
10.2.1.3	Translation Moves	274
10.2.1.4	Rotational Moves	274
10.3	The Condition of Microscopic Reversibility and Importance Sampling	277
10.4	Monte Carlo Simulations in Other Ensembles	279
10.4.1	Grand Canonical Monte Carlo Simulations	279
10.4.2	Isothermal–Isobaric Monte Carlo Simulations	283
10.4.3	Biased Monte Carlo Sampling Methods	284
10.5	Gibbs Ensemble Monte Carlo Simulations	285
10.5.1	Simulations of Liquid–Gas Phase Equilibrium	285
10.6	Simulations of Gas Adsorption in Porous Solids	288
10.6.1	Simulations of the Gas Adsorption Isotherm and Heat of Adsorption	288
10.6.2	Force Fields for Gas Adsorption Simulations	291
10.6.3	Block Averaging of Data from Monte Carlo and Molecular Dynamics Simulations	291
	Chapter 10 Appendices	295
10.A.1	Thermodynamic Relation for the Heat of Adsorption	295
	References	297
	Index	317
