a

adhesive diffusion model 265–269
 allografts 101
 Arruda–Boyce model 151
 athermal systems 222

b

biodegradable hydrogel-based meniscus
 scaffolds 109
 biomacromolecular networks 1–19
 Blundell–Terentjev model 3
 Boltzmann distribution 255, 259
 bottle-brush polymer 189–191, 215, 216,
 223–227, 237
 “brittle” functional polymers 68

c

Cauchy–Green deformation tensor 6
 1-chain model 4
 3-chain model 5, 9, 11
 8-chain model 5–6, 8
 coarse-grained MD (CGMD) models 28,
 39
 computer simulations 176, 192, 193,
 200, 201
 cross-linked elastomer networks
 200–209
 density 204–206
 distribution 206–208
 models and simulation methodology
 201–202
 temperature 208–209
 topology 202–204

cross-linked polymer network
 active nanoparticles–non-equilibrium
 effects 192
 molecular simulation 183
 Cai–Paniukov–Rubinstein and
 Dell–Schweizer theories 183–185
 stiffness and geometry 185–189
 nanoparticle dynamics 175
 nanoparticle hopping diffusion
 microscopic theory 182
 scaling theory 176–182
 nanoparticles with anisotropic shape
 191–192
 network strands with nonlinear
 architectures 189–191
 sticky and polymer-tethered
 nanoparticles 191
 cylindrical gel 157
 diffusio-mechanical model 162–164
 exact solution for 163–164

d

deformable nanoparticles (DNPs)
 255–260
 diffusio-mechanical model
 cylindrical gel 162–164
 disk-shaped gel 164–166
 spherical gel 158–162
 diffusio-mechanical theory 149–172
 diffusion process 149, 152, 171, 248, 253,
 255, 258, 261, 273
 direct ink writing (DIW) 73
 disk-shaped gel 157–158, 164–166

 - 15–16, 17

m

macromolecular network
 analytical model 289
 chain flexibility of strands 282
 dynamical heterogeneity 283–284
 MC simulations and experimental data 287–288
 nonmonotonic feature 284–287
 free energy landscape 289
 hierarchical structures 281, 282
 topology 288
 dictated scaling regimes 291–294
 mediated dynamical regimes 294–295

macromolecular networks 281

Marko–Siggia model 3

mean squared displacement (MSD) 250, 285

meniscectomy 101

meniscus
 anatomy, biochemical content, and cells 102–104
 biomaterial requirements 105–106
 biomechanical properties 104

meniscus extracellular matrix (mECM) 107

meniscus scaffolds
 mimicking microstructure 122–123

meniscus suture surgery 101

mesenchymal stem cells (MSCs) 111

mesoscopic 26

microscopic theory 182

minimal model 96

model elastomer networks 200–214

modified SRP (mSRP) 29

molecular dynamics (MD) simulations 27, 200

Mooney–Rivlin model 6

mucus
 mechanisms 247
 permeability 246
 rigidity 248

multiple particle tracking (MPT) 248, 270

n

nanoparticle diffusion
 in attractive networks 232–236
 bottlebrush elastomers 223–227
 grating 218–223
 models and simulation methodology 215–216, 227–228
 size effect 228–232
 size effect on nanoparticle diffusion 216–218

nanoparticles (NPs)
 with different rigidity and mucus network 252–255
 distribution 256–258
 in mucus 261
 in biological hydrogels 263–265
 polyethylene glycols 269–272
 shapes 261–263
 theoretical model 265–269

negative Poynting effect 11

neo-Hookean model 4, 6, 7, 15, 151

network stability 10–11

network topology 41, 53, 202–204, 288–291

neutron spin echo (NSE) 93, 94

non-adhesive diffusion model 265–268

non-concatenated ring polymers 189, 190

non-covalent bonds 55–56, 60

nonlinear elasticity 9–10

non-scaling theoretical approach 182

normal stress 11–12

o

Ogden model 7

Onsager principle states 160

Onsager variational principle (OVP) 149, 152

osteoarthritis (OA) 101

p

permanent macromolecular networks
 1-chain model 4
 3-chain model 5
 4-chain model 5
