

Index

a

- absolute permittivity 8
- Al-disk-array/ Al_2O_3 /Al perfect absorber 156, 157
- Amptek “COOL-X” miniature X-ray generator 231
- applications 231
- combined output spectrum 232
- cooling phase spectrum 232
- features 231–233
- heat and cool output flux 232
- heating phase spectrum 232
- AlN films 98
- AlN pyroelectric detector 101
- artificial pyroelectric materials 28
- Au Pt–PZT–Pt pyroelectric IR detector on silicon substrate 124, 125
- auto image calibration 74

b

- $\text{Ba}_{0.66}\text{Sr}_{0.34}\text{TiO}_3$
 - induced pyroelectric coefficient 60, 61
 - permittivity vs. temperature at various bias fields 60, 61
- barium strontium titanate ($\text{Ba}_x\text{Sr}_{1-x}\text{TiO}_3$) 28, 60, 63, 72–75, 122
- barium titanate (BTO) ceramic-based hybrid NG 183, 198, 206, 207
- BaTiO_3 26, 42, 43, 72, 96
- bilayer-structured pyroelectric sensor 91
- bismuth sodium titanate (BNT) based lead-free ceramics 96

- BNKLT lead-free ceramic samples, for sensor applications 97
- BNKT-based ceramic 97
- boracite 25
- breakdown field 16
- BST Broadband Pyro-Electric Infrared Area Detector 74–75

c

- caesium nitrate (CsNO_3) 28
- calamine 24–25
- calcium doped strontium barium niobate ceramics, pyroelectric properties of 76
- calcium modified lead titanate ($\text{Pb}_{1-x}\text{Ca}_x\text{TiO}_3$, PCT) thin films 86
- calcium-modified lead titanate (PCT) thin film pyroelectric infrared (IR) detectors 86, 87
- capacitance of a parallel plate capacitor 7–9
- Carnot cycle 178–179
- ceramic based PyNG 198
 - lead-free 204–208
 - PZT based 201–204
 - self-powered flexible p-Si/n-ZnO NWs heterojunction PDs 200–201
 - ZnO based pyroelectric nanogenerators 198–201
- ceramic-polymer composites 90–96
- Clausius–Mossotti relation 12

- CMOS (complementary metal-oxide-semiconductor) compatible pyroelectric detector 100–102, 127, 129, 141, 153, 156, 158
- cobalt phthalocyanine 28
- coefficients of thermal expansion 20
- collagen 35
- conductive ferroelectric domain walls (EFDWs) 45
- continuous phase transitions 40
- converse coefficient 38
- crystal negative polarity 230
- crystal positive polarity 230
- cubic ABO_3 perovskite-type unit cell 77
- Curie temperature 41, 56, 60, 72–74, 76, 77, 79, 98, 120, 121, 178, 211
- Curie–Weiss law 46
- d**
- Debye relaxation 6
- Debye's approximation 33
- depolarization field 7, 10
- deuterated and L-alanine-doped triglycine sulfate (DLaTGS) detectors 28, 66–68
- for infrared microscopy 67
- deuterated TGS (DTGS) 63–66, 68, 121, 158
- dielectric(s) 1
- capacitance of a parallel plate capacitor 7–9
- Debye relaxation 6
- dielectric constant 9–10
- dielectric relaxation 5–6
- dielectrics breakdown 15–16
- dielectrics losses 12–13
- electric displacement field 9
- electric susceptibility 9–10
- electronic polarization 3–4
- ionic polarization 4
- local field 10
- molecular theory of induced charges 6
- orientation polarization 4
- polarization of 2–3
- space charge polarization 4–5
- dielectric breakdown 15, 16, 179
- dielectric constant 4, 5, 7, 9, 46, 59, 62, 63, 65–67, 73, 74, 76, 78–86, 90, 92–95, 99, 120, 125
- dielectric dispersion 5
- dielectric loss angle 13–14
- dielectric losses 12–15, 65, 76, 90, 161
- dielectric loss index (factor) 15
- dielectric relaxation 5–6, 94
- dielectric strength 16
- dielectric susceptibility 12
- domain switching 39
- domain wall(s) 39, 42
- motion 43
- nanoelectronics 45
- double-crystal arrangement, for neutron generator 228, 229
- dual-element PZT pyroelectric IR detector design 28, 125
- e**
- elastic compliance coefficients 20
- electric displacement field 9–10
- electric susceptibility 9–10, 12
- electrocaloric effect 24
- electromagnetic shielding hybrid NG (ES-HNG) 193
- electrometer 23
- electronic polarization 2–6, 32
- electrostriction coefficients 38, 39
- Ericsson cycle 179–180
- Er^{3+} modified PVDF (Er-PVDF) film 187, 188
- Eu-doped SBN 76
- f**
- Faraday cup-target setup for ion current measurement 225
- fast high-density non-volatile random access memory (FeRAMs) 43
- ferroelectric(s) 55–57
- domains 39, 42–45, 205
- hybrid focal-plane IR detector 122, 123

- lead zirconate titanate thin films 81
- ferroelectric materials 57, 178
- Curie temperature 178
- as IR detectors, operating modes for 60–61
- ferroelectricity 39
- domain-wall motion 43
- ferroelectric domains 42
- phase transition 40–41
- soft-mode 45–46
- ferromagnetism 39
- field-effect transistors (FeFETs) 43, 57, 59, 120, 121, 162
- field of dipoles inside cavity 11–12
- first-order phase transitions 40
- flexible $\text{Pb}(\text{Zr}_{0.52}\text{Ti}_{0.48})\text{O}_3$ (PZT) film-based hybrid piezoelectric-pyroelectric NG 203
- free-standing and strain-free gallium nitride (GaN) temperature dependent pyroelectric coefficient of 102
- g**
- Galileo probe net flux radiometer 27, 29
- gallium nitride (GaN) 28
- based pyroelectric materials 102
- resonators performance 155
- Gibbs free energy 6
- graphene pyroelectric bolometer 162, 163
- device architecture 163–164
- performance 164–165
- h**
- high-grade heat 173
- high performance pyroelectric infrared (IR) detector 81, 86
- high-performance wearable pyroelectric sensor 90
- hybrid ferroelectric 1,4-diazabicyclo [2.2.2]octane perrenate (dabcoHReO₄) nanofibre-based PyNG 205
- hybrid focal plane array detector 28, 122, 126–127
- hybrid PyNG 190, 191
- i**
- induced dipole moment 2
- induced dipoles 7
- infrared sensor based KNN/[P(VDF-TrFE)70:30] composite thick film 96
- integrated flexible hybrid energy cell 197
- integrated resonant absorber pyroelectric detector 148
- design 149
- sensitivity 150
- ionic polarization 2, 4, 5, 32
- IR detectors, classes of 119
- IR sensor 126
- equivalent circuit of 126
- j**
- Joule heat 16
- Joule–Lenz law 12
- k**
- Kramers–Kronig relations 10
- Kundt powder patterns 24–25
- l**
- lapis electricus* 21
- lead-free ceramics 96–97
- based pyroelectric nanogenerators 204–208
- lead zirconate-lead titanate $(1-x)\text{PbZrO}_3-x\text{PbTiO}_3$ -PZT perovskite solid solution 78
- lead zirconate titanate (PZT) 35, 42, 84, 89, 93, 94, 97, 120, 162, 182
- thin films 79
- lead zirconate titanate $\text{Pb}(\text{Zr,Ti})\text{O}_3$ 42, 89
- LiNbO₃/PVDF composites for thermal/infrared sensing applications 95

- linear pyroelectric array
 - detector assembly 129
 - detector chip technology 127–129
 - fundamental structure of 127
 - PYROLINE 256 camera system 129–131
 - LiSO₄-doped TGS crystals 66
 - lithium niobate (LiNbO₃) 63, 67–72, 95, 96, 146, 158, 163, 230
 - lithium niobite (LN) crystals 67–72
 - lithium tantalate (LiTaO₃) 28, 29, 63, 67–72, 78, 80, 84, 94, 95, 102, 121, 127–131, 137, 139, 140, 146, 221, 222, 224, 226–230
 - crystal structure 67–68
 - lithium tantalate (LT)
 - Terahertz pyroelectric detector 71
 - thin films 69
 - Lorentz field 10, 11
 - Lorentz–Lorentz equation 12
 - Lorentz relation 11
 - loss of power 12, 13
 - low-grade heat 173, 208
 - low-grade thermal energy harvesting technologies 173
 - low-noise un-cooled infrared radiation detection 103
 - LT/PVDF nano composite film 94
 - Lyddane–Sachs–Teller relation 46
 - lyncurium 21, 22
 - lyngourion 21
- m**
- manganese doped lead zirconate titanate thin films 81
 - material dispersion 5, 10
 - material figure-of-merits (FoMs) 60, 62, 66, 76, 80, 81, 83, 86, 92, 95, 96
 - mechanical hybrid NGs 192, 194, 197–198
 - medium-grade heat 173
 - MEMS-based hybrid plasmonic–pyroelectric detector 158
 - MEMS processing techniques 154
 - MEMS pyroelectric IR detector 101
 - miniature pyroelectric X-ray generator “COOL-X” (battery operated) 232–233
 - Mn-doped 0.74Pb(Mg_{1/3}Nb_{2/3})O₃–0.26 PbTiO₃ crystals 84
 - Mn-doped PZT thin films 82
 - modified Ericsson cycle 180
 - modified lead titanate (PT) 85
 - based thick films 86
 - molecular theory of induced charges 6–7
 - multi-channel LT pyroelectric detectors 71
 - multi-component ferroelectric ceramic materials 79
 - multi-frequency band pyroelectric sensor 104–106
 - multiferroics 39
 - multilayer Pb(Zr_{0.3}Ti_{0.7})O₃/PbTiO₃ thin films, poling of 82
- n**
- nanowire ferroelectric polymers based PyNG 191, 193
 - nature heat 173
