Part I Fundamental of Universe, Matter, Condensed Matter and Materials 1

1	Universe, Matter, Condensed Matter and Materials	3
1.1	Features of the Universe and Fundamental Constants	4
1.2	Structure and Composition of Matter	9
1.2.1	Classification and Characteristics of Matter (Radiation Coupling and Energy Conservation)	9
1.2.2	Fundamental Particles	9
1.2.3	Fundamental Forces	11
1.3	Fundamental Constants Describing the Universe and Matter	15
1.4	Experiments to Study Fundamental Particles and Forces	20
1.5	Introduction to Condensed Matter and Materials	27
1.5.1	Classification of Condensed Matter	28
1.5.2	Structures and Compositions of Condensed Matter or Materials	30
1.5.3	Intrinsic Properties of Condensed Matter and Materials	32
1.6	Main Research Areas in Condensed Matter Physics	33
	Questions for Thinking	34
	References	34
2	The Laser Interferometer Gravitational-Wave Observatory	37
2.1	A Brief History of Gravitational and Gravitational-Wave Measurements	37
2.2	Fundamentals of LIGO and Related Facility Development	39
2.2.1	Detecting Gravitational Waves	41
2.2.2	Educational Analogy Experiments	44
2.2.2.1	Herriott Delay Line	45
2.3	Key Components of the LIGO Facility	47
2.3.1	Coherent Laser Source and Laser	47
2.3.2	The Laser Interferometer Detector	47
2.3.3	Fourier Transform and Signal Processing System	48
2.4	Application of LIGO	49
2.4.1	Detection of a Supernova Explosion	49
2.4.2	Detection of Black Hole Fusion	50
	Questions for Thinking	51
	List of Abbreviations	51
	References	51

3	Fundamentals of Crystallography: Microstructures and Crystal Phases of Condensed Matter	55
3.1	The Microstructure of Condensed Matter and Materials	55
3.1.1	The Microscale	55
3.1.2	The Hard-Sphere Model	56
3.1.3	Energy and Packing	57
3.1.4	Crystals, Quasicrystals and Amorphous Structures	58
3.2	The Unit Cell	60
3.2.1	Lattice and Motif	60
3.2.2	Lattice and Crystal Structure	61
3.2.3	Unit Cell and Unit Vectors	61
3.2.4	Unit Cells, Bravais Lattices and Crystal Systems	63
3.2.5	Unit Cells and Their Parameters	65
3.3	Crystal Structures (Phases)	65
3.3.1	Close Packing and Stacking	65
3.3.2	The Face-Centered Cubic (FCC) Lattice and its Parameters	67
3.3.3	The Body-Centered Cubic (BCC) Lattice and its Parameters	69
3.3.4	The Hexagonal Close-Packed (HCP) Lattice and its Parameters	70
3.3.5	Point Coordinates and Crystallographic Directions	71
3.3.6	Crystallographic Families and Symmetry	72
3.3.7	Coordinate Transformations	72
3.3.8	Crystallographic Planes and Miller Indices	73
3.3.9	Linear Density, Planar Density and Crystal Density	74
3.4	Quasicrystals	77
3.4.1	A Brief History of Quasicrystals	77
3.4.2	Phase and Structure Characteristics of Quasicrystals	79
	Questions for Thinking	79
	References	80

Part II Electromagnetic Spectroscopy 81

4	Elements of X-Ray Diffraction	83
4.1	Diffraction of X-Rays	83
4.1.1	The Kinematical Theory of Diffraction	85
4.1.2	The Dynamical Diffraction Theory	85
4.1.3	The Mechanism of the Interaction between X-Rays and the Unit Cell	86
4.1.4	Scattering of X-Rays and the Structure Factor of the Unit Cell	86
4.2	Development of X-Ray Diffraction	88
4.3	Generation of X-Rays	91
4.3.1	X-Ray Tubes: Cathode Ray Tube Structure	91
4.3.2	The Interaction of X-Rays with Matter	92
4.3.2.1	Scattering of X-Rays	92
4.3.2.2	Absorption of X-Rays by Matter	93
4.4	Applications	94
4.4.1	Crystal Phase Analysis	94
4.4.2	Determination of Inner Stress of Condensed Samples	97
4.4.2.1	Measurement of Residual Stress in Polycrystalline Materials	98
4.4.2.2	Measurement of Residual Stress in Single-Crystalline Materials	100
	Questions for Thinking	101
	References	101

5	X-Ray Fluorescence Spectroscopy (XRF)	103
5.1	Theoretical Foundations	103
5.2	General Setup of an XRF Spectrometer	104
5.3	Types of XRF Analyzers	107
5.4	History and Current Status of XRF	108
5.5	Applications	109
5.6	Appendix	112
5.6.1	Analysis of XRF Spectra	112
5.6.2	Total Reflection XRF, Proton-Excited XRF and Synchrotron Radiation XRF Spectrometry	113
	Questions for Thinking	114
	References	114
6	X-Ray Emission Spectroscopy (XES)	115
6.1	Principles of XAS and XES	115
6.2	Classification of XES	118
6.3	History of XES and Common XES Spectrometers	119
6.4	Applications	119
	Questions for Thinking	121
	References	121
7	X-Ray Absorption Spectroscopy (XAS)	123
7.1	The Physics of XAS	123
7.1.1	The Principle of X-Ray Absorption Near-Edge Structure (XANES) Spectroscopy	123
7.1.2	The Principle of Extended X-Ray Absorption Fine Structure (EXAFS) Spectroscopy	124
7.2	Generation of X-Ray Synchrotron Radiation	125
7.2.1	The Structure of Synchrotron Radiation Facilities	126
7.2.2	Synchrotron Radiation Facilities Around the World	127
7.3	Applications of XANES Spectroscopy	132
7.4	Applications of EXAFS Spectroscopy	133
7.5	Differences Between EXAFS and XANES	133
	Questions for Thinking	134
	References	134
8	X-Ray Raman Scattering (XRS)	137
8.1	Interaction of Light and Matter in XRS	137
8.2	A Brief History of XRS Spectrometers	139
8.3	Components of an XRS Spectrometer	141
8.3.1	X-Ray Scattering Crystal Detector	141
8.3.2	High-Resolution Crystal Detector	142
8.3.3	A Superlattice Thin-Film Mirror Surface as a Double Multilayer Monochromator	142
8.3.4	The Detection of Scattered Photons in XRS	143
8.4	Applications of XRS	143
8.4.1	Chemistry	143
8.4.2	Polymer Science	143
8.4.3	Materials Science	144
8.4.4	Biology	145
8.4.5	Chinese Herbal Medicine	146

8.4.6	Gem Research	146
8.4.7	Investigation of Cultural Relics	147
8.5	Summary and Outlook	147
	Questions for Thinking	148
	References	148
9	Fourier-Transform Infrared (FTIR) Spectroscopy	149
9.1	General Scope of FTIR Spectroscopy	149
9.2	A Brief History of IR Spectrometers	150
9.3	Basic Concepts	150
9.4	Setup of a Standard FTIR Instrument	153
9.5	Advantages of FTIR Spectroscopy	155
9.5.1	Signal-to-Noise Ratio and Linearity	155
9.5.2	Accuracy	155
9.5.3	Data Handling Facility	155
9.5.4	Mechanical Simplicity	155
9.6	Key Elements of an FTIR Spectrometer	156
9.6.1	IR Light Source and Laser	156
9.6.2	Michelson Interferometer and Beam Splitter	156
9.6.2.1	Michelson Interferometer	156
9.6.2.2	Measuring and Processing the Interferogram	158
9.6.2.3	Beamsplitter	160
9.6.3	Infrared Photodetector	160
9.6.4	Fourier Transform and Signal Processing System	161
9.7	Spectral Range	161
9.7.1	Far Infrared	161
9.7.2	Mid Infrared	161
9.7.3	Near Infrared	161
9.8	Application of FTIR Spectroscopy	162
9.8.1	Biological Materials	162
9.8.2	Microscopy and Imaging	162
9.8.3	Studies at the Nanoscale and Spectroscopy Below the Diffraction Limit	162
9.8.4	FTIR Systems as Detectors in Chromatography	162
9.8.5	Thermogravimetric Analysis	163
9.8.6	Emission Spectroscopy and IR Chemiluminescence	163
9.8.7	Kinetics of Chemical Reactions and Spectra of Transient Species	163
	Questions for Thinking	164
	References	164
10	Energy-Dispersive X-Ray (EDX) Spectroscopy of Elements	167
10.1	Principles of EDX Spectroscopy	167
10.1.1	Production of Characteristic X-Rays	167
10.2	A Brief History of EDX Spectrometer Development	169
10.3	Key Components of EDX Spectrometers	170
10.3.1	The X-Ray Generator	170
10.3.2	The Vacuum System	170
10.3.3	The X-Ray Detector	171
10.3.3.1	The Semiconductor Detectors	171
10.3.3.2	The Direct Detectors	172
10.3.3.3	The Indirect Detectors	172
10.3.4	The Signal Processing System	173
10.4	Applications of EDX Spectroscopy	173

- 10.4.1 Surface Penetration 173
- 10.4.2 Elemental Resolution, Reliability, and Errors 173
- 10.4.3 Characteristics of EDX Energy Spectrometers 174
- Questions for Thinking 175
- References 176

Part III Characterization Methods Based on the Particle (Electron or Electron Beam, Neutron)–Matter Interaction 177

- 11 Scanning Electron Microscopy (SEM) 179**
 - 11.1 Interaction Between the Electron Beam and Matter 180
 - 11.1.1 Elastic Scattering 180
 - 11.1.2 Inelastic Scattering 181
 - 11.2 Signal Detection 182
 - 11.2.1 Primary and Secondary Electrons 183
 - 11.2.2 Backscattered Electrons and Auger Electrons 183
 - 11.2.3 The Relation Between Surface Topography and Secondary Electrons 184
 - 11.2.4 The Relation Between Atomic Number z and Backscattered Electrons 184
 - 11.3 History of SEM Development 185
 - 11.4 Key Components of SEM Devices 186
 - 11.4.1 Electron Beam Sources 186
 - 11.4.1.1 Thermionic Electron Guns 186
 - 11.4.1.2 Field-Emission Electron Guns 187
 - 11.4.2 Electronic Detectors 187
 - 11.4.3 Signal Processing and Imaging System 188
 - 11.5 Application and Expansion of SEM 190
 - 11.5.1 Analysis of Powder Particles 190
 - 11.5.2 Fracture Analysis 190
 - 11.5.3 Observation and Analysis Metallographic Structures 190
 - 11.5.4 Dynamic Study of Fracture Processes 191
 - Questions for Thinking 191
 - References 191
- 12 Transmission Electron Microscopy (TEM) 193**
 - 12.1 The Interaction Between Electrons and Atoms 193
 - 12.1.1 Transmitted Electrons and Bright-Field Image 195
 - 12.2 Brief History of EM and TEM Development 195
 - 12.3 Key Components of EM and TEM Instruments 198
 - 12.3.1 The Basic Structure of a TEM 198
 - 12.3.1.1 Illumination System 198
 - 12.3.1.2 Electron Gun 199
 - 12.3.1.3 Electromagnetic Lenses 199
 - 12.3.1.4 Imaging System 201
 - 12.3.1.5 Viewing and Recording System 202
 - 12.4 Applications and Extensions of TEM 202
 - 12.4.1 Analysis of Microstructure and Morphology 202
 - 12.4.2 Element Distribution and Morphology Analysis Using EDX Combined with TEM 203
 - 12.4.3 High-Angle Annular Dark-Field (HAADF) STEM 204
 - Questions for Thinking 205
 - References 206

13	Spherical-Aberration-Corrected Transmission Electron Microscopy (SAC-TEM) 207
13.1	The Principle of Spherical Aberration Correction 207
13.2	History of SAC-TEM and Spherical Aberration Correctors 207
13.2.1	The Development of SAC-TEM 207
13.2.2	Spherical Aberration Correctors 208
13.3	Applications of SAC-TEM or SAC-STEM 210
13.3.1	Atomic Structure Characterization 210
13.3.2	Surface and Interface Study 210
