

## Contents

### Preface *xi*

<b>1</b>	<b>Surface Energetic Principles for Moisture Storage in Porous Materials</b>	<b>1</b>
1.1	Introduction	1
1.2	Surface Energy and Spreading of Liquids on Solid Surfaces	3
1.2.1	Explanations on Surface Energy and Surface Tension	3
1.2.2	Dependence of Surface Energy of Water on Temperature, on Relative Humidity of Air, and for Aqueous Salt Solutions	6
1.2.3	Spreading of Liquids on a Solid Surface	7
1.2.4	Determining the Surface Energies of Solid Surfaces	9
1.3	Basic Equations for Liquid Absorption in Material Pores	10
1.3.1	Liquid Absorption in Pores by Effect of Surface Energies	10
1.3.1.1	Derivation of the Capillary Rise via the Adhesion Works and the Potential Energy in Capillaries	10
1.3.1.2	Capillary Pressure in Cylindrical Pores and in Slit Pores	11
1.3.1.3	Capillary Pressure as a Cause of Fluid Transport and Rise Height in a Capillary Pore	12
1.3.2	Pore Filling by Capillary Condensation	13
1.3.2.1	Extent of Validity of the Kelvin Equation	16
1.3.3	Saturation Vapor Pressure at the Surface of Convex Shapes	16
1.3.4	Explanations of the Young–Laplace Equation for Stress on Curved Fluid Surfaces	17
1.3.5	Application of Kelvin Equation to Floating Droplets	19
1.3.6	Solubility of Gases in Water	19
1.3.7	Cavitation in the System Water/Vapor	21
1.4	Sorptive Storage on Material Surfaces and on the Inner Surface of Pore Systems	22
1.4.1	Preliminaries	22
1.4.2	Measured Surface Sorption of Water Vapor on Flat Nonporous Surfaces	23

1.4.3	Use of Water Vapor Sorption Isotherms to Determine the Value of the Internal Surface Area	24
1.4.3.1	Total Internal Surface Determined Using BET Method	25
1.4.3.2	Total Internal Surface Determined by the Method of Adolphs and Setzer	29
1.4.4	Calculation of the Pore Size-Dependent Distribution of the Inner Surface Using the Moisture Storage Function	30
1.4.4.1	Determination of the Net Sorptive Storage Function	31
1.4.4.2	Basic Equation for the Pore Size-Dependent Distribution of the Inner Surface	33
1.4.4.3	Application of the Basic Equations with Regard to the Material REF	33
1.4.4.4	Calibration of the Pore Shape Parameter and Calculation of the Internal Surface Distribution of the Material REF	34
1.4.4.5	Distribution of the Volume of the Internal Adsorbed Water Films	36
1.4.5	Equations for Capillary Condensation Considering Adsorbed Liquid Films	37
1.4.6	Modeling of Adsorption Film Thicknesses	38
1.4.6.1	Modeling of Vapor Adsorption on Flat Nonporous Surfaces	38
1.4.6.2	Modeling of Sorption Film Thicknesses in Cylindrical Pores with Influence of Surface Curvature on the Thicknesses of Adsorbed Films	40
1.4.6.3	Volume of Adsorbed Water in the Not-yet-water-filled Pore Area	44
1.4.6.4	Film Thicknesses Due to Adsorption in the Water-filled Pore Region Behind the Meniscus, Estimation Using a Surface Energy Approach	45
1.4.6.5	Volume of Adsorbed Water Molecules on the Inner Surface in the Water-filled Pore Area	49
1.4.7	Molecular Simulations and Experimental Investigations on the Dimension of Adsorbed Film Thicknesses (International Research Results)	50
1.4.8	Influence of Adsorption Films on Meniscus Formation and on Capillary Pressure in Capillary Pores	56
	References	59

## **2 Real Pore Structure and Calculation Methods for Composition Parameters**

2.1	Illustration of the Pore Structure of Selected Materials	65
2.1.1	Pore Structure of the Synthetic Material MCM-41 and Selected Ceramic Bricks	65
2.1.2	Results on the Pore-microstructure of Cement-Bound Materials	68

2.1.3	Applicability of Theoretical Modeling to Cement-Bound Material Possessing the Morphology Shown	74
2.2	Calculations on Porosity, Degree of Hydration, and Material Densities	77
2.2.1	Calculations of Initial Composition Parameters of Concretes	78
2.2.2	Required Hydration-Related System Parameters for the Method of Powers/Hansen	81
2.2.3	Total Porosity of the Hardened Cement Paste or Concrete After Standard Drying	81
2.2.4	Pore Fractions of Gel and Capillary Pores in the Total Pore Volume $V_{pores}$	82
2.2.5	Chemical Shrinkage of the Hydrating Cement Product	83
2.2.6	Calculation of the Densities $\rho_{wet}$ , $\rho_{humid}$ , and $\rho_{dry}$	84
2.2.7	Definition of the System Parameters for the Powers/Hansen Method	86
2.2.7.1	Water Fraction $W_{chem0}$ Required for Hydration of Cement Clinker	86
2.2.7.2	Volume-Reduction Coefficient $k_{chem}$ and Chemical Shrinkage of the Hydrating Cement Product	87
2.2.7.3	Definition of the Characteristic Value $k_{gel}$ to Calculate the Gel Pore Volume	88
2.2.7.4	Coefficient $k_{phys}$ for Estimating the Physically Bound Water and the Necessary Water-Cement Value	90
2.2.8	Dependence of the Attainable Degree of Hydration on the Water/Cement Ratio	91
2.2.9	Equations to Describe Hydration Kinetics	93
2.2.10	Comparison of a Predicted and Measured Composition of a Cement Paste as a Function of the Degree of Hydration	96
	References	98
<b>3</b>	<b>Basic Equations for the Description of Moisture Transport</b>	<b>103</b>
3.1	Moisture Flows at the Volume Element	103
3.1.1	Capillary Pressure as Transport Potential	104
3.1.2	Consideration of the Temperature Influence on the Capillary Transport Coefficients	105
3.1.3	Note on the Difference Between Capillary Pressure and Hydraulic External Pressure	106
3.1.4	Influence of Salinity and Temperature on Fluid Transport Coefficients	108
3.1.5	Diffusivity as Transport Coefficient for Water Saturation as Driving Potential	110
3.1.6	Comments on the Issue of Moisture Transport Modeling Based on Diffusivity or Permeability	111
3.1.7	Diffusivity and Permeability Coefficients for Mortars and Concrete	112
3.1.8	Methods for Determining the Transport Parameters	113

- 3.1.8.1 Measurement of the Hydraulic Conductivity [m/s] via Hydraulic Pressure 113
- 3.1.8.2 Transport Coefficients by Measurements of the Electrical Conductivity 114
- 3.1.8.3 Prediction of Permeability [ $\text{m}^2$ ] According to Katz-Thompson 115
- 3.1.8.4 Determination of Diffusivity [ $\text{m}^2/\text{s}$ ] via NMR According to Krus and Rucker-Gramm 118
- 3.1.8.5 Diffusivity [ $\text{m}^2/\text{s}$ ] and Permeability [ $\text{m}^2$ ] via Capillary Sorptivity 118
- 3.1.8.6 Transport Parameters from Reverse Calculations 120
- 3.1.8.7 Relative Diffusivity Modeled from Morphology resp. Structure Data 121
- 3.2 Base Modeling of Moisture Transport 122
- 3.3 Structure of the Simulation Program 128
- References 129

#### **4 Experimental Investigations with Regard to the Modeling of Moisture Transport in Mortars and Concrete 133**

- 4.1 Preliminary Remarks on Moisture Storage 133
- 4.2 Concrete Data for the Experimental Investigations 134
- 4.3 Data on Porosity of the Considered Materials and Influence of Treatments on Porosity 135
  - 4.3.1 MIP Results for Pore Size Distribution and Pore Volume 135
  - 4.3.2 Control of the Carbonation Behavior of the Test Specimens 137
  - 4.3.3 Air-Porosity Content of the Materials Used 140
  - 4.3.4 Drying Methods and Influence of Drying 143
    - 4.3.4.1 Drying Methods 143
    - 4.3.4.2 Possible Influence of Drying on Capillary Water Uptake 147
- 4.4 Hysteretic Moisture Storage Behavior as Important Issue with Respect to Modeling 150
  - 4.4.1 Adsorption and Desorption Isotherms of the CEMI Reference Material 150
  - 4.4.2 Causes of Differences Between Adsorption and Desorption Isotherms 152
  - 4.4.3 Questions with Respect to Modeling of Storage and Transport Processes 155
- 4.5 Water Storage Behavior Under Changing Moisture Boundary Conditions with Consideration of the Air-Pore Content 155
  - 4.5.1 Illustration of the Structure-Related Pore Volume Fractions in Relation to the Total Storage Capacity 155
  - 4.5.2 Long-Term Moisture Storage Behavior of Slice-Shaped Test Specimens 156

- 4.5.3 On the Question of Dissolution of Portlandite from Slice-Shaped Test Specimens During Water Storage 159
- 4.5.4 Behavior and Durability of Air-Pores in Cement-Bound Materials 161
- 4.5.5 Influence of Test Specimen Shape on Water Uptake into Air Voids 167
- 4.5.6 Capillary Water Uptake After Drying 169
- 4.5.7 Over-hygroscopic Range in Cement Mortar and Concrete 171
- 4.5.8 Air-Pore Influence on Sorption Isotherms 175
- 4.5.9 Water Storage Behavior of Initially Sealed Hardened Test Specimens 178
- 4.6 Adsorption and Desorption Isotherms 182
  - 4.6.1 Overview of Storage Functions for Different Building Materials 182
  - 4.6.2 Sorption Isotherms and Scanning Isotherms of Hardened Cement Paste and Concrete 185
  - 4.6.3 Primary and Secondary Desorption Isotherms, Reversibility of Structural Changes 190
  - 4.6.4 Modeling the Course of Scanning Isotherms 192
  - 4.6.5 Dependence of Desorption Isotherms on Initial Storage Conditions 198
  - 4.6.6 Using Given Isotherms for Other Concrete Compositions 207
  - 4.6.7 Alternative Experimental Determination of the Slope of Scanning Isotherms 208
  - 4.6.8 Influence of Carbonation on Moisture Storage and Transport Behavior 212
  - 4.6.9 Cavitation in the Pore System During Desorption or Drying 215
  - 4.6.10 Dependence of Sorption Isotherms on Temperature 220
  - 4.6.11 MIP Curve as a Boundary Storage Function at Elevated Temperature 228
  - 4.6.12 Influence of Salt Contents on Moisture Storage 230
- 4.7 Results on Capillary Water Absorption Depending on Initial Water Content and Time 231
  - 4.7.1 Experimental Studies on the Behavior of HCP and Concrete 231
  - 4.7.2 Self-Sealing: Conclusions from NMR Analysis and Computational Results 235
- References 243

## **5 Modeling of Moisture Transport Taking into Account Sorption Hysteresis and Time-Dependent Material Changes 251**

- 5.1 Preliminaries 251
- 5.2 Modeling of Capillary Transport 251
  - 5.2.1 Water Content Dependence of the Water Transport Coefficients 251

5.2.2	Water Content- and Time-Dependence of the Transport Coefficients	256
5.2.3	Computational Modeling of Scanning Isotherms and Hysteretic Moisture Transport	262
5.2.4	Examples of the Hysteresis Influence on Water Content Distributions	266
5.3	Modeling of Vapor Transport and Drying by Evaporation of Concrete	270
5.3.1	Definition and Measurement of Vapor Diffusion Resistance, Influence of Experimental Boundary Conditions on Nominal Measurand	270
5.3.2	Modeling of Vapor Transport Within the Material	274
5.3.3	Importance of Vapor Transfer Coefficient for Vapor Transport Through Wall Elements	276
5.3.4	Influence of Vapor Transfer on Realistic Modeling of Drying Based on Experimental Results	278
5.3.5	Implementation of Modified Vapor Transfer Coefficients	281
5.3.6	Realistic Modeling of Drying by Evaporation	282
5.3.7	Modeling the Influence of Salt Precipitation on the Evaporation Behavior of Concrete Surfaces	288
5.3.7.1	Measurement Results on the Sources and on the Effect of Salt Precipitation	288
5.3.7.2	Consideration of Steady-State and Dynamic Salt Precipitation on Evaporation Rate	291
5.3.7.3	Comparison of Results from One-Sided and Two-Sided Evaporation	295
5.4	Realistic Modeling of Drying by Evaporation for Ceramic Bricks, Calcium Silicate Products, and Porous Concrete	297
	References	305
