Index

Note: Page numbers in *italics* and **bold** refers to figures and tables respectively.

a

aberration-corrected TEM 134–139, *135–138*
ab initio molecular dynamics (AIMD) simulations 46
acquisition mode 150–152, *152*
advanced characterization
  core value of 16
  demand *16*
  limitations 15
  technical requirements 15–16
all-solid-state batteries (ASSBs) 9–10, *10*, 254
anionic-redox reactions (ARR) 43
anode 5–6
artificial intelligence (AI) 362–363, *364*

b

ball-and-spring model 291
battery components
  electrode materials 11–12
  electrolyte 12–14
battery materials
  artificial intelligence (AI) 362–363, *364*
  characterization and simulation 360–362, *361*, *362*
  in-situ characterizations 355–357, *356*, *357*
  multiscale and multi spectroscopic characterizations 358–359, *358*, *359*
beamline
  introduction 156–158, *156*, *158*
  layout diagram *150*
Bohr magneton 266
Bragg reflections 36, *37*
Bragg's Diffraction Law 148

c

calibration curve 295
cathode 4–5
cathode gas evolution 333–339, *335*, *336*, *338*, *339*, *341*
cation-disordered rock salt 45
cation-driven electro-osmotic mechanism 48
CCD detectors 294
Chadwick's discovery 19, *20*
characterization technology
  advanced characterization. *see* advanced characterization
  traditional offline characterization 15
charge compensation mechanism 202–205, *203*, *204*
charge-coupled device (CCD) 97
China Advanced Research Reactor (CARR) 25
China SNS (CSNS) 25–28, *26*, *27*, *29*
column approximation 107
confocal micro-Raman spectroscopy 294, 317–318
contrast imaging 105–106
core functions and operational workflow 145–146
coupled with X-ray diffraction (XRD) 164–165
coupled with X-ray fluorescence (XRF) 162–164
cryogenic electron microscopy 128–131, *129*, *130*
cryogenic TEM (cryo-TEM) 112–113
crystal defect analysis 107–108

d

DC-generative adversarial networks (GAN) 363, *364*
Debye scattering 38
decisive impact 147
deviation parameter 101–103, *102*

differential electrochemical mass spectrometry (DEMS)
  cathode gas evolution 333–339, *335*, *336*, *338*, *339*, *341*
  electrolyte decomposition mechanisms 330–333, *331–333*
  fundamentals of 323–327, *324–327*
  SEI formation, anode interface 340, 342
diffraction contrast images 106–108
diffraction mode 99–100
diffraction pattern calibration 103
dispersive Raman spectrometers 294

e

electrode materials
  anode materials 12
  cathode materials 11–12
electrolyte 6
  liquid electrolyte 12–13
  solid electrolyte 13
  solid-liquid interface of liquid batteries 13–14
  solid-solid interface of solid-state batteries 14
electron beam imaging 95–96
electron diffraction
  deviation parameter 101–103, *102*
  Ewald sphere 101, *101*
  polycrystalline diffraction patterns 104
  SAED and diffraction pattern calibration 103
  secondary diffraction 104–105
  single crystal electron diffraction pattern calibration 103–104
electron energy loss spectroscopy 121–128, *123*, *125*, *126*
electronic structure information 196–197
electron impact ionization (EI) technology 326, *326*, *327*
electron paramagnetic resonance (EPR) technology
  absorption-relaxation-absorption process 267
  anode materials 285–286, *285*
  block diagram of *270*
  cathode materials 277–285, *278–285*
  combination 273
  detection system 271
  electromagnet system 269–270
  field modulation 267, *268*
  influencing factors 271–272
  in-situ electrochemistry 273
  lithium deposition and dendrite 275–277, *276*, *277*
  microwave bridge 269
  modulation system 271
  phenomena/effects 268–269
  principles of 265–266
  pulse-wave 273–274
  quantitative analysis 272–273
  rapid scanning-EPR (RS-EPR) technology 274, *275*
  resonant cavity 270–271
  transmission system 270
  work pattern 272
electron Zeeman splitting 266
elemental composition and valence state 195–196
European Synchrotron Radiation Facility (ESRF) 213
Ewald sphere 101, *101*
extended X-ray absorption fine structure (EXAFS)
  amplitude and phase transferability 242
  Fourier transform and radial distribution 241
  fundamental principles 240–241
  information content 241
  multiple scattering 241
  photoelectron scattering process 241
  single scattering 241

f

Fermi energy 215
Fermi Golden Rule 186
fiber-optic probe Raman spectroscopy 294
focused ion beam SEM (FIB-SEM) 363
Fourier transform Raman spectrometers 294

g

gamma neutron activation analysis 32
global energy transition
  core demand 1
  industrialization and scientific research pattern 2, *3*
  performance driven, terminal application scenarios 1–2

h

hard-carbon anodes 117
Heinz Maier-Leibnitz Research Neutron Source (FRM II) 24, *25*
high- *Q* oscillations 38
high-resolution TEM (HRTEM) images and phase contrast 108–110

i

iDPC-STEM imaging technology 111–112
illumination system 96
imaging and recording system 97–98, *97*
imaging modes 99, 105–106
imaging system 96–97

in-situ and operando sXAS 198–200, *199*
in-situ electrochemical TXM 159–160
in-situ heating 177–179, *178*
in-situ mechanical TXM 161
in-situ synchrotron radiation TXM *159*
in-situ TEM 112, *113*, 131–134, *133*, *134*
in-situ thermal TXM 160–161
interference-based principle 145
intrinsic absorption coefficient 189
inverse PFY (iPFY) method 189
isotope tracing methods 334

j

Jahn-Teller (J-T) distortions 255

k

kinematic approximation 107
Kirkpatrick-Baez mirror focusing system 157

l

Li-rich cation-disordered rock salt cathodes (LRCDRS) 225
lithium- and sodium-ion systems 229
lithium-ion batteries
  anode 5–6
  cathode 4–5
  core composition 4–7, *5*
  development trend and core characteristics 7–8
  electrolyte 6
  schematic diagram *8*
  separator 7
  working principle 3–4, *4*
lithium-sulfur batteries 10–11
local octahedral structure (LOSH) 40

m

Main Focusing Mirror System 149
Maxwell-Boltzmann distribution 267
medium-entropy NASICON framework 117
microscopic atomic pair-density distribution 38
multiphysics-coupled in-situ TXM 161–162
multiplet effect 188

n

National Synchrotron Radiation Laboratory 156
neutron
  Chadwick's discovery 19, *20*
  discovery 19
  vs. electrons *vs.* X-rays 30–32, **30**

two-dimensional TXM (2D TXM) application cases 165–170, *168*

u

^{235}U fission 21–23, **23**
ultra-high vacuum (UHV) environments 231

w

wavelet transform method
advantages of 244–245
basis function 242
energy compaction 245
Haar wavelet 244
inner product operation 243
logarithmic congruence with human vision 245
multiresolution analysis 243
noise control and denoising 245

wavelet transform method (*Cont.*)
principle and fundamental theory 242–244
scaling and translation operations 243
two-scale DWT approach 244

X

X-ray absorption near edge structure (XANES)
absorption and electronic transitions 237
absorption edge 236
core-shell electron 236
dipole and quadrupole transitions 237
fundamental principles 236
history of 235
K-edge features and structural significance 237–239, *238*
L-edge features and structural significance 239, *239*
X-ray absorption spectroscopy imaging (XANES-CT) 157
X-ray absorption spectroscopy (XAS)
background subtraction 250
beamline overview 253–254
conversion to *k*-space and weighting 252
extended X-ray absorption fine structure (EXAFS) 239–242, *251*
fitting analysis 252–253
measurement modes 248–250
monitoring redox reactions 254–255
normalization 251
probing local structure 255–257
raw data preprocessing 250
sample preparation 248–250
standard experimental setup 246–248
surface probing tool 260–261, *260*
time-resolved 257–259, *259*
wavelet transform method 242–245
X-ray absorption near edge structure (XANES) 235–239
X-ray detection 145–147
X-ray diffraction (XRD)
diffraction modes 57–58
dimensional, strain, and defect analysis, LIB materials 85–89, *86–88*
