

## Index

Note: Page numbers in *italics* and **bold** refers to figures and tables respectively.

### **a**

- active cooling systems 125
- active thermal management 127
- advanced composites, for electrolysis and photocatalysis 96–98
- advanced materials, for hydrogen production
  - AI and machine learning 106–108
  - cost-effective and non-precious metal alternatives 102–106
  - durability and degradation challenges in catalyst materials 98–102
  - high-performance catalysts for electrolysis 87–93
  - key challenges in material development 86–87
  - material science 83–86
  - nanomaterials and composites 93–98
- advanced nanomaterials 251
- advanced safety mechanisms 121
- algae-based hydrogen production 61, 62, 65
- alkaline
  - electrolysis 43–45, **44**
  - electrolyzers 86
- alkaline fuel cells (AFC) 160, 164–166
- alloyed nanostructures 94
- alloying strategies 100, **101**
- Alternative Fuels Infrastructure Directive (AFID) 318
- American Society for Testing and Materials 260
- ammonia (NH<sub>3</sub>) 120, 217, 245, 248, 250–251, 310, 334
  - as hydrogen carrier 128–130
  - hydrogen in 342–344
  - LOHC-based hydrogen storage and **131**
- ArcelorMittal 215
- artificial intelligence (AI) 121, 244
  - AI-driven computational models 121
  - AI-driven material discovery 87, 91, 95
  - AI-driven optimization 71, 287, 290–294, **294**
  - AI-driven predictive safety systems 28
  - AI-optimized hydrogen production materials 107–108
  - AI-powered models 291
  - AI-powered simulations 108
  - cost efficiency, enhanced 244
  - deployment of AI-powered predictive maintenance 293
  - for hydrogen production and storage 290–292
  - in hydrogen trading 278
  - in material discovery 106–107
