Preface XXI

List of Contributors XXXI

1	Perspectives in Cytometry	1
	<i>Anja Mittag and Attila Tárnok</i>	
1.1	Background	1
1.2	Basics of Cytometry	2
1.2.1	Flow Cytometry	2
1.2.2	Slide-Based Cytometry	3
1.3	Cytomics	4
1.4	Cytometry – State of the Art	5
1.4.1	Multiparametric Analyses	6
1.5	Perspectives	7
1.5.1	New Technologies and Methods	10
1.5.1.1	Sequential Analyses	11
1.5.1.2	Spectral Analyses	11
1.5.1.3	Fluorescence Modifications for Analyses	12
1.5.1.4	Label-Free Analyses	13
1.5.2	Automation	14
1.5.3	Cytometry – the Other Side	15
1.6	Conclusion	16
	References	16
2	Novel Concepts and Requirements in Cytometry	25
	<i>Herbert Schneckenburger, Michael Wagner, Petra Weber, and Thomas Bruns</i>	
2.1	Introduction	25
2.2	Fluorescence Microscopy	25
2.2.1	Light Dose	25
2.2.2	Cell Systems	26
2.2.3	Methods	27
2.3	Fluorescence Reader Systems	27
2.3.1	Cell-Based Fluorescence Screening	27

2.3.2	TIR Fluorescence Reader	28
2.4	Microfluidics Based on Optical Tweezers	30
2.5	Conclusion	30
	Acknowledgment	31
	References	31
3	Optical Imaging of Cells with Gold Nanoparticle Clusters as Light Scattering Contrast Agents: A Finite-Difference Time-Domain Approach to the Modeling of Flow Cytometry Configurations	35
	<i>Stoyan Tanev, Wenbo Sun, James Pond, Valery V. Tuchin, and Vladimir P. Zharov</i>	
3.1	Introduction	35
3.2	Fundamentals of the FDTD Method	37
3.2.1	The Basic FDTD Numerical Scheme	37
3.2.2	Input Wave Excitation	39
3.2.3	Uniaxial Perfectly Matched Layer Absorbing Boundary Conditions	39
3.2.4	FDTD Formulation of the Light Scattering Properties from Single Cells	40
3.2.5	FDTD Formulation of Optical Phase Contrast Microscopic (OPCM) Imaging	42
3.3	FDTD Simulation Results of Light Scattering Patterns from Single Cells	45
3.3.1	Effect of Extracellular Medium Absorption on the Light Scattering Patterns	45
3.4	FDTD OPCM Nanobioimaging Simulation Results	47
3.4.1	Cell Structure	47
3.4.2	Optical Clearing Effect	47
3.4.3	The Cell Imaging Effect of Gold Nanoparticles	48
3.4.3.1	A Cell with a Cluster of Gold Nanoparticles Located in the Cytoplasm	50
3.4.3.2	A Cell with a Cluster of Gold Nanoparticles Randomly Distributed on the Surface of its Nucleus	52
3.5	Conclusion	57
	Acknowledgment	59
	References	59
4	Optics of White Blood Cells: Optical Models, Simulations, and Experiments	63
	<i>Valeri P. Maltsev, Alfons G. Hoekstra, and Maxim A. Yurkin</i>	
4.1	Introduction	63
4.1.1	White Blood Cells	63
4.1.2	Particle Identification and Characterization	63
4.1.3	Experimental Techniques	64
4.2	Optical Models of White Blood Cells	65

4.2.1	Confocal Imaging of White Blood Cells	65
4.2.2	Optical Models of Mononuclear Cells	65
4.2.3	Optical Models of Granular Cells	67
4.2.4	Refractive Indices of White Blood Cells and their Organelles	68
4.3	Direct and Inverse Light-Scattering Problems for White Blood Cells	69
4.3.1	Simulation of Light Scattering by Mononuclear Cells	69
4.3.2	Simulation of Light Scattering by Granular Cells	70
4.3.2.1	Granulocyte Model Without Nucleus	70
4.3.2.2	Approximate Theories	72
4.3.2.3	Neutrophil Model with Nucleus	72
4.3.3	Inverse Light-Scattering Problem for Mononuclear Cells	73
4.3.3.1	Global Optimization	74
4.3.3.2	Errors of Parameter Estimates	74
4.3.3.3	Theoretical Tests Based on More Complicated Model	76
4.3.3.4	Sample Characterization	77
4.4	Experimental Measurement of Light Scattering by White Blood Cells	78
4.4.1	Scanning Flow Cytometer	78
4.4.1.1	The Current State of the Art of the SFC	79
4.4.1.2	Mueller Matrix of the SFC	80
4.4.2	Differential Scattering Cross Section of White Blood Cells	81
4.4.3	Measurement of Light Scattering of Mononuclear Cells	82
4.4.4	Characterization of Mononuclear Cells from Light Scattering	84
4.4.5	Measurement of Light Scattering of Granular Cells	87
4.5	Conclusion	89
	Acknowledgments	90
	References	90
5	Optical Properties of Flowing Blood Cells	95
	<i>Martina C. Meinke, Moritz Friebe, and Jürgen Helfmann</i>	
5.1	Introduction	95
5.2	Blood Physiology	96
5.2.1	Blood Composition	96
5.2.2	Clinical Parameters	98
5.2.3	Physiological Conditions	99
5.3	Complex Refractive Index of Hemoglobin	100
5.4	Light Propagation in Turbid Media	102
5.4.1	Monte Carlo Simulation	104
5.5	Method for the Determination of Optical Properties of Turbid Media	104
5.5.1	Integrating Sphere Measurements	104
5.5.2	Principle of Inverse Monte Carlo Simulation	106

5.5.3	Possibility of Determining the Intrinsic Parameters	107
5.5.4	Preparation of the Blood Samples	108
5.5.4.1	Red Blood Cells	108
5.5.4.2	Plasma	108
5.5.4.3	Platelets	109
5.6	Optical Properties of Red Blood Cells	109
5.6.1	Standard Red Blood Cells	110
5.6.2	Optical Parameters of Red Blood Cells Dependent on Hematocrit	112
5.6.3	Influence of Oxygen Saturation	115
5.6.4	Influence of Shear Rate	117
5.6.4.1	Shear Rate Range 0–200 s ⁻¹	118
5.6.4.2	Shear Rate Range 200–600 s ⁻¹	119
5.6.4.3	Shear Rates at 1000 s ⁻¹	119
5.6.5	Influence of Osmolarity	119
5.7	Optical Properties of Plasma	122
5.7.1	Influence of the Surrounding Medium on Red Blood Cells	124
5.8	Optical Properties of Platelets	126
5.9	Comparison of Optical Influences Induced by Physiological Blood Parameters	127
5.10	Summary	129
	Acknowledgments	129
	References	129
6	Laser Diffraction by the Erythrocytes and Deformability Measurements	133
	<i>Sergei Yu. Nikitin, Alexander V. Priezzhev, and Andrei E. Lugovtsov</i>	
6.1	Introduction	133
6.2	Parameters of the Erythrocytes	134
6.3	Parameters of the Ektacytometer	135
6.4	Light Scattering by a Large Optically Soft Particle	136
6.5	Fraunhofer Diffraction	138
6.6	Light Scattering by a Transparent Elliptical Disc	140
6.7	Light Scattering by an Elliptical Disc with Arbitrary Coordinates of the Disc Center	143
6.8	Light Diffraction by an Ensemble of Particles	144
6.9	Light Diffraction by Particles with Random Coordinates	145
6.10	Light Scattering by Particles with Regular Coordinates	146
6.11	Description of the Experimental Setup	147
6.12	Sample Preparation Procedure	149
6.13	Examples of Experimental Assessment of Erythrocyte Deformability in Norm and Pathology	150
6.14	Conclusion	153
	References	153

7	Characterization of Red Blood Cells' Rheological and Physiological State Using Optical Flicker Spectroscopy	155
	<i>Vadim L. Kononenko</i>	
7.1	Introduction	155
7.2	Cell State-Dependent Mechanical Properties of Red Blood Cells	156
7.3	Flicker in Erythrocytes	158
7.3.1	Phenomenology of Cell Membrane Flickering	159
7.3.2	Theoretical Models of Flicker	160
7.3.2.1	Models with Various Cell Shape under Thermal Excitation	162
7.3.2.2	Flat Disk Model	166
7.3.2.3	Active Excitation Mechanisms	171
7.4	Experimental Techniques for Flicker Measurement in Blood Cells	173
7.4.1	Measurement of Frequency Spectra of Membrane Flickering	173
7.4.1.1	Phase Contrast and Laser Probing of Central Part of Erythrocyte Disk	173
7.4.1.2	Point Probing of Cell Edge Fluctuations	178
7.4.2	Quantitative Phase Imaging of Entire Cell	179
7.4.3	Registration of Fluctuations in Cell Circumference Shape	182
7.4.4	Fundamental Difference between the Registered Spectra and the Intrinsic Flicker Spectrum	183
7.5	The Measured Quantities in Flicker Spectroscopy and the Cell Parameters Monitored	187
7.5.1	Frequency Spectra	187
7.5.1.1	Disk Face Area of Erythrocyte	187
7.5.1.2	Equatorial Contour and Rim Area	188
7.5.2	Modal Composition	189
7.5.2.1	Disk Face Area of Erythrocyte	189
7.5.2.2	Equatorial Contour	191
7.5.3	Mean Square Amplitude Distribution	191
7.6	Flicker Spectrum Influence by Factors of Various Nature	192
7.6.1	Ambient Physical Conditions	193
7.6.1.1	Effect of Medium Viscosity	193
7.6.1.2	Effect of Ambient Temperature	194
7.6.1.3	Effect of Medium Tonicity	195
7.6.2	Modification of Cell Mechanical Properties	197
7.6.3	Physiologically Active Substances and Medicinal Drugs	198
7.6.4	Erythrocyte Flicker at Human Pathologies	200
7.7	Membrane Flicker and Erythrocyte Functioning	201
7.8	Flicker in Other Cells	203
7.9	Conclusions	204
	References	205

8 **Digital Holographic Microscopy for Quantitative Live Cell Imaging and Cytometry** 211

Björn Kemper and Jürgen Schnekenburger

- 8.1 Introduction, Motivation, and Background 211
- 8.2 Principle of DHM 212
 - 8.2.1 DHM Setup and Imaging 212
 - 8.2.2 Evaluation of Digital Holograms 213
 - 8.2.3 Quantitative Phase Contrast Imaging and Cell Thickness Determination 216
 - 8.2.4 DHM Multifocus Imaging and Cell Tracking 217
- 8.3 DHM in Cell Analysis 221
 - 8.3.1 Cell Cultures 222
 - 8.3.2 DHM Cell Thickness Measurements 223
 - 8.3.3 Dynamic Cell Thickness Monitoring in Toxicology 224
 - 8.3.4 Label-Free Detection of Apoptotic Processes 227
 - 8.3.5 Determination of the Integral Refractive Index of Cells in Suspension 228
 - 8.3.6 Identification of Subcellular Structures 232
- 8.4 Conclusion 234
- Acknowledgment 234
- References 234

9 **Comparison of Immunophenotyping and Rare Cell Detection by Slide-Based Imaging Cytometry and Flow Cytometry** 239

József Bocsi, Anja Mittag, and Attila Tárnok

- 9.1 Introduction 239
 - 9.1.1 Cytometry of Equal Quality? 240
 - 9.1.2 Fluorescence Analyses 240
 - 9.1.2.1 Excitation and Emission of Fluorescent Dyes 240
 - 9.1.2.2 Quantum Dots 241
 - 9.1.2.3 Bleaching Characteristics of Dyes 243
 - 9.1.2.4 Fluorescent Light Detection 243
 - 9.1.2.5 Spillover Characteristics 244
 - 9.1.3 Two Ways of Cytometric Analysis 244
 - 9.1.3.1 Flow Cytometry 244
 - 9.1.3.2 Slide-Based Cytometry 246
- 9.2 Comparison of Four-Color CD4/CD8 Leukocyte Analysis by SFM and FCM Using Qdot Staining 247
 - 9.2.1 Analysis of Lymphocytes by SFM and FCM 247
 - 9.2.2 Comparison of CD4/CD8 Ratio 248
- 9.3 Comparison of Leukocyte Subtyping by Multiparametric Analysis with LSC and FCM 250
 - 9.3.1 Different Triggering in LSC Analysis 250
 - 9.3.2 Immunophenotyping by FCM and LSC 254
 - 9.3.3 Multicolor Analyses 256

9.4	Absolute and Relative Tumor Cell Frequency Determinations	256
9.4.1	Comparison of Cell Counts	257
9.4.1.1	Dilution Series	257
9.4.1.2	Rare Cell Analysis	259
9.4.2	Analysis Documentation	259
9.4.3	Limitations	261
9.5	Analysis of Drug-Induced Apoptosis in Leukocytes by Propidium Iodide	262
9.5.1	Induction of Apoptosis	263
9.5.2	Apoptosis Detection by SBC and FCM	265
9.6	Conclusion	266
	Acknowledgment	266
	References	266
10	Microfluidic Flow Cytometry: Advancements toward Compact, Integrated Systems	273
	<i>Shawn O. Meade, Jessica Godin, Chun-Hao Chen, Sung Hwan Cho, Frank S. Tsai, Wen Qiao, and Yu-Hwa Lo</i>	
10.1	Introduction	273
10.1.1	Main Components of a Full-Scale Flow Cytometer	273
10.1.1.1	Fluidic Control System	273
10.1.1.2	Optical Detection System	274
10.1.1.3	Sorting Modules	274
10.1.2	Microfluidic Flow Cytometry	275
10.2	On-Chip Flow Confinement	275
10.2.1	A General Discussion of Flow Confinement Forces	276
10.2.2	Two-Dimensional Flow Confinement	277
10.2.3	Three-Dimensional Flow Confinement	278
10.3	Optical Detection System	283
10.3.1	The Many Benefits of Integrated Optics	283
10.3.2	Developing the Tools of the Trade	284
10.3.2.1	Light-Guiding Elements	284
10.3.2.2	Two-Dimensional Refractive Elements	286
10.3.2.3	Improving Quality of On-Chip Optics	288
10.3.2.4	Light-Stopping and Reflecting Elements	290
10.3.2.5	Spectral Separation	290
10.3.2.6	Tunable Liquid-Core Waveguides and Lenses	290
10.3.3	Opportunities for Significant Improvements over Bulk Optical Systems	292
10.4	On-Chip Sorting	297
10.4.1	Electrokinetic Sorting	297
10.4.2	Sorting by Dielectrophoresis	298
10.4.3	Sorting by Optical Force	299
10.4.4	Hydrodynamic Sorting	300
10.4.4.1	Hydrodynamic Sorting with External Check Valves	301

10.4.4.2	Hydrodynamic Sorting with Piezoelectric Actuators	301
10.5	Conclusion	306
	Acknowledgments	306
	References	306
11	Label-Free Cell Classification with Diffraction Imaging Flow Cytometer	311
	<i>Xin-Hua Hu and Jun Q. Lu</i>	
11.1	Introduction	311
11.2	Modeling of Scattered Light	313
11.2.1	The Correlation between Scattered Light Distribution and Cellular Structure	314
11.2.2	The Formulation of Stokes Vector and Muller Matrix	316
11.3	FDTD Simulation with 3D Cellular Structures	318
11.3.1	The FDTD Algorithm	318
11.3.2	Acquisition of 3D Cell Structure through Confocal Imaging	321
11.4	Simulation and Measurement of Diffraction Images	322
11.4.1	Numerical Results Based on FDTD Simulations	323
11.4.2	Experimental Results Acquired with a Diffraction Imaging Flow Cytometer	325
11.5	Summary	327
	Acknowledgments	328
	References	328
12	An Integrative Approach for Immune Monitoring of Human Health and Disease by Advanced Flow Cytometry Methods	333
	<i>Rabindra Tirouvanziam, Daisy Diaz, Yael Gernez, Julie Laval, Monique Crubezy, and Megha Makam</i>	
12.1	Introduction	333
12.2	Optimized Protocols for Advanced Flow Cytometric Analysis of Human Samples	335
12.2.1	Key Limitations of Current Experimental Approaches: Technical and Scientific Biases	335
12.2.2	Developing Better Protocols for Flow Cytometry Studies of Cells from Human Subjects: Enabling Holistic Studies of Human Health and Disease	336
12.2.3	Integrating Flow Cytometry into a Wider Framework for Experimental Research on Human Samples	339
12.3	Reagents for Advanced Flow Cytometric Analysis of Human Samples	341
12.3.1	Antibody Probes	341
12.3.2	Nonantibody Probes	347
12.3.3	Adapting Protocols to the Research Question at Hand: A Few Practical Examples	352

- 12.4 Conclusion: The Future of Advanced Flow Cytometry in Human Research 355
 Acknowledgments 359
 Abbreviations 359
 References 360
- 13 Optical Tweezers and Cytometry 363**
Raktim Dasgupta and Pradeep Kumar Gupta
- 13.1 Introduction 363
- 13.2 Optical Tweezers: Manipulating Cells with Light 364
- 13.2.1 Basics Principles 364
- 13.2.2 Experimental Considerations 366
- 13.3 Use of Optical Tweezers for the Measurement of Viscoelastic Parameters of Cells 367
- 13.3.1 Red Blood Cells 368
- 13.3.1.1 Use of Multiple Optical Traps 369
- 13.3.1.2 Use of Counterpropagating Light Beams 372
- 13.3.1.3 Use of Evanescent Wave of Light 373
- 13.3.1.4 Use of Viscous Drag on Optically Trapped Cell 373
- 13.3.2 Cancer Cells 374
- 13.3.3 Stem Cells 376
- 13.4 Cytometry with Raman Optical Tweezers 376
- 13.4.1 Raman Optical Tweezers: Basics 376
- 13.4.2 Cytometry Applications 378
- 13.4.2.1 Real-Time Study of Dynamic Processes in Single Cell 378
- 13.4.2.2 Identification and Sorting of Microorganism 379
- 13.4.2.3 Studies on Disease Diagnosis 381
- 13.5 Cell Sorting 381
- 13.6 Summary 383
 References 383
- 14 *In vivo* Image Flow Cytometry 387**
Valery V. Tuchin, Ekaterina I. Galanzha, and Vladimir P. Zharov
- 14.1 Introduction 387
- 14.2 State of the Art of Intravital Microscopy 388
- 14.2.1 General Requirements 388
- 14.2.2 Intravital Video Microscopy (IVM) 389
- 14.2.3 Fluorescent Intravital Video Microscopy (FIVM) 389
- 14.2.4 Experimental Preparations for IVM: Animal Models 390
- 14.2.5 Microcirculation and Cell Flow Examination 392
- 14.2.5.1 Microcirculation and Cell Flow 392
- 14.2.5.2 Light Microscopy 392
- 14.2.5.3 High-Resolution High-Speed Transmission Digital Microscopy (TDM) 393
- 14.2.5.4 Monitoring of Cells in Lymph Flow 395

14.2.5.5	Fluorescent Image Microscopy	396
14.2.5.6	Laser Scanning Microscopy	397
14.2.5.7	Laser Doppler Perfusion Imaging and Laser Speckle Contrast Imaging	399
14.2.5.8	Other Intravital Techniques	400
14.2.5.9	Conclusion	401
14.3	<i>In vivo</i> Lymph Flow Cytometry	401
14.3.1	Basic Idea: Natural Cell-Focusing Phenomenon	401
14.3.2	Animal Model and Experimental Arrangement	402
14.3.3	Lymph Flow Velocity Measurements	406
14.3.4	Imaging of Cells and Lymphatic Structures	409
14.3.5	Summary	415
14.4	High-Resolution Single-Cell Imaging in Lymphatics	415
14.4.1	The High-Speed TDM	415
14.4.2	Optical Clearing for <i>In vivo</i> Label-Free Image Cytometry	417
14.5	<i>In vivo</i> Blood Flow Cytometry	418
14.5.1	The Specificity of Blood Flow Cytometry	418
14.5.2	The High-Speed, High-Resolution Imaging Blood Flow Cytometry	421
14.5.3	The Limitations and Future Perspectives	422
14.5.4	Summary	423
14.6	Conclusion	424
