

TADDOLs, their Derivatives, and Taddol Analogs: Versatile Chiral Auxiliaries

Dieter Seebach*, Albert K. Beck, Alexander Heckel

What follows is a list that to the best of our knowledge includes all the currently known TADDOL derivatives^[467] together with references to available X-ray structural data (CSD Refcodes wherever possible) and citations of literature sources in which these derivatives are prepared, utilized, or discussed. Metal complexes have not been listed separately. References for the latter are appended to references for the corresponding free ligands. Derivatives with the configurations (*R,R*) (unlabeled) or (*S,S*) (labeled „ent“) as well as racemates („rac“) and *meso* compounds („meso“) are listed separately. A few derivatives that contain two TADDOL units could not be integrated.^[72,79,149] Moreover, there also exist a number of dendritically modified^[63,71,363,371,372,376] and solid-phase-bound TADDOL derivatives^[71,198,366-370,372,377,468,469] that could not be specified within the limits of this table. Patent literature has not been considered (roughly 60 patents have been issued related to TADDOLs and their application).

The following structure applies:

	R ¹	R ²	Arl	X•••Z•••Y	X-ray structure	References
