Rh(I)-Catalyzed C-C Bond Activation: Seven-Membered Ring Synthesis by a [6+1] Carbonylative Ring Expansion Reaction of Allenylcyclobutanes **

Paul A. Wender,* Nicole M. Deschamps, Robert Sun

Reactions were carried out in oven-dried glassware sealed with rubber septa under a positive pressure of carbon monoxide from a balloon, unless otherwise indicated. Liquids and solutions were transferred via syringe or stainless steel cannula. Reactions were run using Teflon-coated magnetic stir bars. Elevated temperatures were maintained in thermostat-controlled oil baths. Elevated carbon monoxide pressures were maintained using a pressure reaction vessel purchased from Andrew’s Glass Co. Organic solutions were concentrated using a Büchi rotary evaporator with a desktop vacuum pump. Thin layer chromatography plates were visualized by ultraviolet light and treatment with acidic $p$-anisaldehyde stain followed by gentle heating. Chromatographic purification of products was accomplished by flash chromatography. Silica gel 60, 230-400 mesh was purchased from EM Science. $\{[\text{RhCl}(\text{CO})_2]_2\}$ was purchased from Strem Chemicals. DCE (99+%, ACS reagent grade), TCE, toluene, and $m$-xylene were purchased from Aldrich Chemical Co. and were used as received. Carbon monoxide (2.5 grade) was purchased from Praxair.

NMR spectra were measured on a Varian INOVA 500 (1H at 500 MHz, 13C at 125 MHz), Varian Mercury 400 (1H at 400 MHz, 13C at 100 MHz), or Varian Gem-300 (1H at 300 MHz, 13C at 75 MHz) magnetic resonance spectrometer. Data for 1H NMR spectra are reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, dd = doublet of doublets, dt = doublet of triplets, ddd = doublet of doublet of doublets, dq = doublet of quartets, septd = septet of doublets, sept = triplet of septets, m = multiplet), coupling constant (Hz), and integration. Nuclear Overhauser effect (nOe) data were measured at 500 MHz and are reported as follows: H (irradiated) → H (observed), % enhancement. Data for 13C are reported in terms of chemical shift and quantity of carbons. Infrared spectra were recorded on a Perkin-Elmer Spectrum BX Fourier transform spectrometer (IR) and are reported as follows: wavenumbers (cm$^{-1}$), description (w = weak, m = medium, s = strong, b = broad). High-resolution mass spectra (HRMS) were recorded at the NIH regional mass spectrometry facility at the University of California, San Francisco. Reported mass values are with error limits of ±1 millimass unit. Elemental analyses (EA), (%C, %H) were determined by Desert Analytics, Tucson, Arizona. Reported atomic percentages are within error limits of ±0.4%.

Experimental and Characterization

General Procedure for the 1,2 addition of 1-bromo-3-methyl-1,2-butadiene into cyclobutanones:

\begin{align*}
\text{O} & \quad \text{Br} \\
n-\text{BuLi, ether, THF} & \quad \text{HO} \\
\end{align*}

To a solution of 1-bromo-3-methyl-1,2-butadiene$^i$ (2.52g, 17 mmol) in ether (16 mL) at -78 °C was added $n$-BuLi (1.6 M in hexane, 10.7 mL, 17 mmol) via syringe over five minutes. The
mixture was allowed to stir at -78 °C for 45 minutes. To this mixture was added a solution of cyclobutanone (400 mg, 5.7 mmol) in THF (8 mL) via syringe over two minutes. The mixture was allowed to stir for an additional 30 minutes before warming up to room temperature in 20 minutes. The reaction mixture was quenched with sat. NH₄Cl solution at room temperature. The crude was extracted with ether. The organic layer was washed with brine, and dried over Na₂SO₄. After concentration of solvent, the residue was purified by flash chromatography with silica gel (11% Et₂O/pentane) to afford alcohol 2i (510 mg, 65%) as a colorless oil. The compound was chromatographically homogenous.

Allenyl cyclobutane 2 (20 mg, 0.079 mmol) was weighed into an oven-dried borosilicate test tube equipped with a magnetic stir bar. The substrate was dissolved in toluene (0.4 mL) and [RhCl(CO)₂]₂ (3.1 mg, 0.0079 mmol) was added in one portion. The test tube was capped with a rubber septum, the septum was then punctured with a disposable 16G1/2 needle and the test tube was placed in the pressure vessel. The vessel was pressurized to two atmospheres of CO and was placed in a preheated thermostat-controlled oil bath at 80 °C. The solution was stirred for 24 h at which time TLC indicated that the starting material was consumed. The solution was cooled to room temperature and was purified via flash chromatography on silica gel (gradient elution 100% pentane \( \rightarrow \) 10% Et₂O/pentane). Product-containing fractions were combined and concentrated by rotary evaporation to yield ketone 3 (21 mg, 93%) as a yellow oil. The compound was chromatographically homogeneous.

NaH (60% dispersion in mineral oil, 69 mg, 1.7 mmol) was added portion-wise over 2 min to a solution of allenyl alcohol 5i (223 mg, 0.86 mmol) in DMF (1.7 mL). The mixture was stirred for 20 min at room temperature under a positive pressure of nitrogen. 2-bromoethyl methyl ether (0.808 mL, 8.6 mmol) was added drop-wise via syringe over 30 seconds. The reaction mixture was stirred at room temperature for 6 h at which point TLC indicated that the starting material had not been consumed. An additional batch of NaH (60% dispersion in mineral oil, 200 mg, 5 mmol) was added portion-wise over 2 min. This was followed by the drop-wise addition of 2-bromoethyl methyl ether (0.4 mL, 4.3 mmol) via syringe over 30 seconds. The reaction mixture was stirred for 1 h and was quenched by the portion-wise addition over 2 min of saturated aqueous NH₄Cl (30 mL). The product was extracted with diethyl ether (3x10 mL). The combined organic extracts were washed with brine (3x10 mL), dried over MgSO₄, vacuum-filtered through a fritted funnel, and then concentrated using a rotary evaporator. The residue was purified by flash chromatography with silica gel (gradient elution 100% pentane → 8% Et₂O/pentane). NaH (60\% dispersion in mineral oil, 166 mg, 4.14 mmol) was added portion-wise over 2 min to a solution of allenyl alcohol 8i (253 mg, 1.04 mmol) in DMF (2 mL). The mixture was stirred for 20 min at room temperature under a positive pressure of nitrogen. 2-bromoethyl methyl ether (0.390 mL, 4.14 mmol) was added drop-wise via syringe over 30 seconds. The reaction mixture was stirred at room temperature for 6 h at which point TLC indicated that the starting material had been consumed. The reaction was quenched by the portion-wise addition over 2 min of saturated aqueous NH$_4$Cl (4 mL). The product was extracted with diethyl ether (3x4 mL). The combined organic extracts were washed with brine (3x4 mL), dried over MgSO$_4$, vacuum-filtered through a fritted funnel, and then concentrated using a rotary evaporator. The residue
was purified by flash chromatography with silica gel (gradient elution 100% pentane → 5% Et₂O/pentane). Product-containing fractions were combined and concentrated using a rotary evaporator to yield allenyl ether 8 (257 mg, 82%) as a colorless liquid. The compound was chromatographically homogeneous.

Allenyl cyclobutane 15 (30 mg, 0.113 mmol) was weighed into an oven-dried borosilicate test tube equipped with a magnetic stir bar. The substrate was dissolved in m-xylene (0.23 mL) and [RhCl(CO)₂]₂ (0.9 mg, 0.0023 mmol) was added in one portion. The test tube was capped with a rubber septum. The resulting yellow solution was stirred under an atmosphere of CO (balloon, 1 atm) and was vented to a bubbler via an outlet needle for 10 min. The outlet needle was removed and the solution was then immersed into a thermostat-controlled oil bath preheated to 80 °C. The solution was stirred for 20 h at which time TLC indicated that the starting material was consumed. The solution was cooled to room temperature and was purified via flash chromatography on silica gel (gradient elution 5% Et₂O/pentane → 10% Et₂O/pentane). Product-containing fractions were combined and concentrated by rotary evaporation to yield ketone 16 (17.5 mg, 53%) as a colorless oil. The compound was chromatographically homogeneous.

To a solution alcohol 17i (268 mg, 2.4 mmol) in DMF (8 mL) at room temperature was added NaH (60% in mineral oil, 151 mg, 3.8 mmol) portion wise over 5 minutes. The mixture was allowed to stir at room temperature for 45 minutes. This was followed by the addition of 2-bromoethyl methyl ether (2.2 mL, 23.6 mmol) via syringe over 20 seconds. The crude was allowed to stir at room temperature for 24 hours at which point TLC indicated the starting material was consumed. The reaction was quenched with sat. NaHCO₃ at room temperature. The mixture diluted with ether. The organic layer was washed with H₂O, brine, and dried over MgSO₄. After removal of the solvent, the residue was purified via flash chromatography with silica gel (pentane / ether = 19 / 1) to afford glycol 17 (205 mg, 76%, one spot by TLC) as a colorless oil.

Cycloheptenone 21 (16 mg, 0.057 mmol) was dissolved in CHCl₃ (1 mL). HCl (1% in MeOH, 10 µL) was added in one portion and the reaction mixture was stirred at room temperature for 3 min at which point TLC indicated that the starting material had been consumed. The solution was cooled to room temperature and was purified via flash chromatography on silica gel (gradient elution 100% pentane → 5% Et₂O/pentane → 10% Et₂O/pentane). Product-containing fractions were combined and concentrated by rotary evaporation to yield cycloheptadienone 21-hydrolyzed (11.5 mg, 87%) as a colorless oil. The compound was chromatographically homogeneous.

Data for 21-hydrolyzed:

TLC: R_f = 0.70 (12% EtOAc/pentane), one blue spot with p-anisaldehyde stain.

H NMR (500 MHz, CDCl₃): δ = 3.50 (d, J = 18.4 Hz, 1H, C1-H), 2.93 (d, J = 18.4 Hz, 1H, C1-H), 2.71 (d, J = 1.7 Hz, 1H), 2.62 (dd, J = 9.5, 1.5 Hz, 1H, C2-H), 2.42 (dd, J = 15.9, 2.6 Hz, 1H, C4-H), 2.34 (dd, J = 15.9, 14.0 Hz, 1H, C4-H), 2.15-1.99 (m, 2H, C3-H), 1.98 (d, J = 2.0 Hz, 3H, C5-HMe), 1.83 (d, J = 1.2 Hz, 3H, C6-Me), 1.56-1.54 (m, 2H), 1.41-1.36 (m, 1H), 1.26-1.21 (m, 1H), 1.17-1.13 (m, 2H) ppm.

C NMR (125 MHz, CDCl₃): δ = 210.0, 204.8, 142.9, 128.6, 58.4, 46.7, 44.5, 43.3, 41.7, 37.5, 34.5, 30.0, 26.9, 22.5, 21.7 ppm.

IR (thin film): 2950 (m), 2871 (m), 1699 (s), 1636 (m), 1449 (w), 1372 (w), 1288 (w), 1250 (w), 1226 (w), 1200 (w), 1180 (w), 1070 (w), 1041 (w), 998 (w), 933 (w), 876 (w), 784 (w) cm⁻¹.

HRMS (EI, m/z): Calcd for C₁₅H₂₀O₂: 232.1463 g/mol (M⁺). Found: 232.1462 g/mol.

Melting point: 79-80 °C.
