Multifunctional Iridium Complexes Based on Carbazole Modules as Highly Efficient Electrophosphors

Wai-Yeung Wong,* Cheuk-Lam Ho, Zhi-Qiang Gao, Bao-Xiu Mi, Chin-Hsin Chen, Kok-Wai Cheah, and Zhenyang Lin
**Experimental Section**

*General Information:* All reactions were performed under nitrogen. Solvents were carefully dried and distilled from appropriate drying agents prior to use. Commercially available reagents were used without further purification unless otherwise stated. All reactions were monitored by thin-layer chromatography (TLC) with Merck pre-coated glass plates. Flash column chromatography and preparative TLC were carried out using silica gel from Merck (230-400 mesh). Fast atom bombardment (FAB) mass spectra were recorded on a Finnigan MAT SSQ710 system. Proton NMR spectra were measured in CDCl₃ on a Varian Inova 400 MHz FT-NMR spectrometer; chemical shifts were quoted relative to tetramethylsilane.

*Physical Measurements:* UV-vis spectra were obtained on a HP-8453 spectrophotometer. The photoluminescent properties and lifetimes of the compounds were probed on the Photon Technology International (PTI) Fluorescence Master Series QM1 system. The phosphorescence quantum yields were determined in CH₂Cl₂ solutions at 293 K against fac-[Ir(ppy)₃] as a reference standard (Φₚ = 0.40). For solid-state emission spectral measurements, the 325 nm line of a He–Cd laser was used as an excitation source. The luminescence spectra were analyzed by a 0.25 m focal length double monochromator with a Peltier cooled photomultiplier tube and processed with a lock-in-amplifier. Electrochemical measurements were made using a BAS CV-50W model potentiostat. A conventional three-electrode configuration consisting of a platinum working electrode, a Pt-wire counter electrode, and an Ag/AgCl reference electrode was used. The supporting electrolyte was 0.1 M [Bu₄N]PF₆. Ferrocene was added as a calibrant after each set of measurements, and all potentials reported were quoted with reference to the ferrocene-ferrocenium (Fc/Fc⁺) couple at a scan rate of 100 mV s⁻¹. Thermal analyses were performed with the Perkin-Elmer TGA6 thermal analyzer.
Preparation of 1 and 2: First, the N-arylation of carbazole was achieved in a large scale by the Ullmann-type condensation between the easily accessible carbazole and p-iodoarene.\cite{1} After bromination with one equivalent of \( N \)-bromosuccimide (NBS) to give the \( N \)-arylated 3-bromocarbazoles, the carbazolylpyridine ligands \( \mathbf{L}_1 \) and \( \mathbf{L}_2 \) were prepared by reacting 3-bromo-9-arylcarbazole (6.21 mmol) with 1.2 equivalent of 2-(tributylstanny1)pyridine (7.45 mmol) in toluene (30 mL) in the presence of \([\text{Pd(PPh}_3]^4\) (0.07 g) under nitrogen. After reflux for 2 days, the dark mixture was poured into water and extracted with ethyl acetate. The concentrated filtrate was purified on a silica column to give \( \mathbf{L}_1 \) and \( \mathbf{L}_2 \) as brown oils in 54–60%. \([\text{Ir(acac)}]_3\) (0.30 mmol) and an excess of \( \mathbf{L}_1 \) (or \( \mathbf{L}_2 \)) (1.04 mmol) were heated to reflux in glycerol (10 mL) for 24 h. The solution was then cooled and extracted with \( \text{CH}_2\text{Cl}_2 \). The concentrated filtrate was purified by TLC over silica using \( \text{CH}_2\text{Cl}_2 \) as eluent. From the first bright yellow band in each case, 1 and 2 can be obtained as yellow solids. Spectral Data: 1: 35%. \(^1\text{H NMR (CDCl}_3\): \( \delta \) (ppm) 8.29 (s, 3H, Ar), 8.00 (m, 6H, Ar), 7.76 (m, 3H, Ar), 7.57 (m, 3H, Ar), 7.32–7.25 (m, 9H, Ar), 6.90 (m, 9H, Ar), 6.62 (m, 9H, Ar), 6.38 (m, 3H, Ar). **X-ray Crystallographic Details.** Yellow crystals of 1 suitable for X-ray diffraction studies were grown by slow evaporation of its solution in CH\textsubscript{2}Cl\textsubscript{2}/diethyl ether at room temperature. Geometric and intensity data were collected at 293 K using graphite-monochromated Mo–K\textalpha radiation ($\lambda = 0.71073$ Å) on a Bruker Axs SMART 1000 CCD diffractometer. The collected frames were processed with the software SAINT\textsuperscript{[2a]} and an absorption correction (SADABS)\textsuperscript{[2b]} was applied to the collected reflections. The structure was solved by the Direct methods (SHELXTL)\textsuperscript{[3]} in conjunction with standard difference Fourier techniques and subsequently refined by full-matrix least-squares analyses on $F^2$. Hydrogen atoms were generated in their idealized positions and all non-hydrogen atoms were assigned with anisotropic displacement parameters. Crystal data for 1: C\textsubscript{69}H\textsubscript{43}N\textsubscript{6}Ir·2CH\textsubscript{2}Cl\textsubscript{2}, $M_w = 1320.16$, monoclinic, space group $P1$, $a = 12.7149(6)$, $b = 14.1335(6)$, $c = 17.7369(8)$ Å, $\alpha = 81.235(1)$, $\beta = 74.257(1)$, $\gamma = 71.128(1)^\circ$, $V = 2895.6(2)$ Å\textsuperscript{3}, $Z = 2$, $\rho_{\text{calcd}} = 1.514$ mg m\textsuperscript{-3}, $\mu(\text{MoK}\alpha) = 2.540$ mm\textsuperscript{-1}, $F(000) = 1324$, $T = 293$ K. 17323 reflections measured, of which 14895 were unique ($R_{\text{int}} = 0.0197$). Final $R_1 = 0.0347$ and $wR_2 = 0.0790$ for 12252 observed reflections with $I > 2\sigma(I)$. CCDC-607186 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
**Molecular Orbital Calculations.** Density functional calculations at the B3LYP level were performed based on their experimental geometry obtained from the X-ray data. The basis set used for C, N, O and H atoms was 6-31G while effective core potentials with a LanL2DZ basis set were employed for the Ir atom. All the calculations were carried out using the Gaussian 03 program. All the MO plots were made with the use of Molden 3.5.

**Procedures of Device Fabrication.** All OLEDs with the emission area of 0.1 cm² were fabricated on the pre-patterned ITO-coated glass substrate having an ITO sheet resistance of 30 Ω/sq. Substrates were cleaned by ultrasonication in detergent and dried at 120 °C for more than 2 h. The substrates were treated by UV ozone before loaded into the vacuum chamber. The doped emission layer was deposited by co-evaporation from two separate sources. The vacuum was less than $5 \times 10^{-6}$ torr during all organic materials deposition and below $8 \times 10^{-6}$ torr during cathode deposition. The $J$–$V$–$L$ characteristics of the devices were measured with a computer controlled KEITHLEY 236 source meter and PHOTORESEARCH PR650 spectrophotometer in air without device encapsulation. All the measurements finished within 20 min after the device was unloaded from the vacuum chamber.
