General protocol. Unless noted otherwise, all reactions were performed in flame dried round bottom flasks fitted with rubber septa, under a nitrogen atmosphere. All air or moisture sensitive liquids were transferred by syringe or stainless steel cannulae. In addition, all air or moisture sensitive solids were handled in a nitrogen-filled glovebox. Flash chromatography was conducted using 60 silica (mesh 230-400) from EM Science.

Reagents. All reagents were purchased from Lancaster, Sigma-Aldrich, Alfa-Aesar, or Fluka Chemicals and were used as received unless otherwise stated. Anhydrous THF and ether were obtained via distillation from sodium benzophenone at 760 Torr. Anhydrous dichloromethane was obtained via distillation from CaH₂ at 760 Torr and toluene was distilled from sodium metal at 760 Torr.

Instrumentation. Proton and carbon nuclear magnetic resonance (¹H & ¹³C NMR) spectra were recorded on Varian-Mercury 400 (400 MHz), Inova-500 (500 MHz) or Inova-600 (600 MHz) spectrometers. Chemical shifts for protons are reported in parts per million (ppm) downfield from tetramethylsilane and are referenced against the chloroform lock signal (¹H, 7.26; ¹³C, 77.0 ppm). Data is reported as follows: chemical shift, integration, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, dd = doublet of doublets, m = multiplet) coupling constants (Hz) and proton assignment. Infrared spectra (IR) were recorded on a Mattson-Galaxy Series FTIR 3000 spectrophotometer referenced to a polystyrene standard. Absorbancies are reported in wave numbers (cm⁻¹) and their relative intensities assigned as strong (s), medium (m), or weak (w). Optical rotations were measured using a 2 mL cell on a Jasco DIP 370 digital polarimeter. Mass spectra were obtained from the Harvard University mass spectrometry service. Chiral HPLC analysis was performed on a Shimadzu VP-series instrument; chiral GC analysis was performed on a Hewlett-Packard 5890 gas chromatograph using a ChiralDEX γ-TA (30 m x 0.25 mm) column or an Alltech Cyclodex β (30 m x 0.25 mm) column.

4) Crystallographic Data

1) Preparation of catalyst 1c
Ligand S-1 was prepared in accordance with the published procedure.¹

**1R, 2S)-Cr(III) catalyst 1c**

To a stirred solution of ligand S-1 (1.0 g, 2.58 mmol) in THF (30 mL) was added anhydrous chromium-(II)-chloride under a gentle flow of nitrogen. The mixture was stirred for 1 h, 2,6-lutidine (1.62 mL, 13.9 mmol) was added, and stirring was continued for an additional 1.5 h. The reaction mixture was then diluted with TBME (60 mL) and washed sequentially with 0.5 N HCl (2 x 100 mL) and brine (200 mL). The organic phase was then separated, dried over anhydrous Na₂SO₄, and concentrated to give a brown solid. Finally, the solid was dried azeotropically three times with anhydrous benzene to afford the desired catalyst 1c (980 mg, 77%) which was used without further purification. Characterization of 1c by X-ray crystallography and CD spectroscopy has been described previously.¹,²

### 2) Substrate Preparation

**General procedure A: Preparation of tertiary alcohols**

\[
\text{RMgX} \quad \text{Et}_2\text{O}, -78 \degree \text{C} \text{to rt} \quad (\text{THP} = 2\text{-tetrahydropyranyl})
\]

To a cold (-78 °C), stirred solution of methyl 2-(tetrahydro-2H-pyran-2-yl)oxy)acetate (7.0 g, 6.1 mL, 40.2 mmol) in ether (100 mL) was added the required alkyl magnesium halide (121 mmol) dropwise over 20 minutes. The reaction mixture was allowed to warm to room temperature and stirring continued for 1 – 24 h. After complete consumption of the starting ester, the reaction mixture was carefully poured onto cold (0 °C) saturated aqueous NH₄Cl solution (200 mL). Additional Et₂O (100 mL) was added and the organic phase separated. The aqueous phase was extracted with Et₂O (2 x 100 mL) and the combined organic extracts washed with brine (200 mL). The organic phase was separated, dried over Na₂SO₄, and concentrated in vacuo to afford the crude product. Purification by column chromatography eluting with 10 – 20% ether / hexanes afforded the desired products.

**General procedure B: Alkylation of tertiary alcohols**

To a cooled (10 °C), stirred solution of the tertiary alcohol (35.9 mmol) in N,N-dimethylformamide (50 mL) was added tetrabutylammonium iodide (2.6 g, 7.2 mmol). The solution was then cautiously treated with sodium hydride (951 mg, 39.5 mmol) and allowed to warm to room temperature over 30 min during which time the solution had turned yellow. The reaction mixture was then treated with the alkyl halide (43.8 mmol) and stirred until no starting material remained by TLC. The solution was then cooled to 0 °C, carefully quenched by the addition of water (ca. 0.5 ml / mmol of NaH) and diluted with ether (60 mL). The ethereal solution was washed with water (2 x 300 mL) and then brine (300 mL) before being separated and dried (Na2SO4). Finally the solvent was removed in vacuo to afford the crude product. Purification by flash chromatography (3 – 5% Et2O / hexanes) afforded the desired products as colorless oils.

General procedure C: Deprotection of THP ethers

The THP ether (25.6 mmol) was dissolved in 4 : 1 : 2 AcOH / H2O / THF (100 mL) and stirred at room temperature until no starting material remained by TLC (ca. 24 – 48 h). The reaction mixture was poured onto cold (4 °C) NaOH before being extracted with ether (3 x 30 mL). The combined organic extracts were washed with brine (100 mL), dried (Na2SO4), and concentrated in vacuo to afford the crude product. Purification by flash chromatography, eluting with 8 – 15% Et2O / hexanes, provided the desired primary alcohols as colorless oils.

General procedure D: Preparation of aldehydes with Dess-Martin periodinane

To a cold (0 °C) stirred solution of the alcohol (2.0 g, 12.7 mmol) in reagent grade CH2Cl2 (50 mL) was added pyridine (1.0 mL, 67.8 mmol) followed by Dess-Martin periodinane (6.4 g, 15.2 mmol). The reaction was stirred until no starting material remained by TLC (ca. 2 – 4 h) at which point hexanes (50 mL) was added. The organic solution was then poured onto a 1:1 mixture of saturated aqueous NaHCO3 (75 mL) and 10% Na2S2O3. The biphasic solution was stirred for 15 minutes, separated, and the aqueous extracted with 1:1 Et2O / hexanes (2 x 50 mL). The combined organic extracts were washed with brine (100 mL), dried (Na2SO4), and concentrated in vacuo to give the crude product. Purification by flash column chromatography, eluting with 5 – 10 % Et2O / hexanes, afforded the desired aldehydes which, unless otherwise noted, could be stored for several months at – 78 °C without deterioration.

Preparation of aldehyde 2b.

2-methyl-1-(tetrahydro-2H-pyran-2-yloxy)propan-2-ol (S-2)

In accordance with general procedure A, methyl 2-(tetrahydro-2H-pyran-2-yloxy)acetate (7.0g, 6.1 mL, 40.2 mmol) was converted to tertiary alcohol S-2 (6.30 g, 89%) as a colorless oil. Rf = 0.08 (10% Et2O / hexanes); νmax / cm⁻¹ (film) 3443 (s), 2943 (s), 2871 (s), 1383 (m); ¹H NMR
In accordance with general procedure B, tertiary alcohol S-2 (6.25 g, 35.9 mmol) was treated with prenyl bromide (5.1 mL, 43.8 mmol, 90%) to afford prenyl ether S-3 (6.45 g, 74%) as a colorless oil. \( R_f = 0.45 \) (10% EtOAc / hexanes); \( \nu_{max} \) / cm\(^{-1} \) (film) 2969 (s), 2938 (s), 2871 (s), 1677 (w), 1453 (m); \(^1H\) NMR (500 MHz, CDCl\(_3\)) \( \delta \) 5.29 (1H, app. tt, J = 1.5, 7, CH\( =C(CH_3)_2 \)), 4.59 (1H, app. t, J = 3.5, OCHO), 3.94 (2H, d, J = 7, OCH\(_2\)), 3.85 – 3.80 (1H, m, OCH\(_2\)), 3.61 – 3.57 (1H, m, CH\(_2\)), 1.85 – 1.78 (1H, m, CH), 1.69 (3H, s, CH\(_3\)), 1.69 – 1.63 (1H, m, CH), 1.62 (3H, s, CH\(_3\)), 1.59 – 1.53 (1H, m, CH), 1.53 – 1.48 (3H, m, CH + CH\(_2\)), 1.23 (3H, s, CH\(_3\)), 1.19 (3H, s, CH\(_3\)); \(^{13}C\) NMR (125.6 MHz, CDCl\(_3\)) \( \delta \) 135.4, 122.2, 98.9, 74.4, 73.3, 61.8, 58.8, 30.5, 25.8, 25.4, 23.4, 23.3, 19.2, 17.9; m/z (ES\(^+\)) 243 ([M+H]), 260 ([M+NH\(_4\)]).

In accordance with general procedure C, prenyl ether S-3 (6.2 g, 25.6 mmol) was deprotected to afford primary alcohol S-4 (3.1 g, 78%) as a colorless oil. \( R_f = 0.12 \) (10% EtOAc / hexanes); \( \nu_{max} \) / cm\(^{-1} \) (film) 3443 (s), 2927 (s), 2973 (s), 2930 (s), 2874 (s), 1677 (w), 1447 (m); \(^1H\) NMR (400 MHz, CDCl\(_3\)) \( \delta \) 5.28 (1H, br. t, J = 7, CH\( =C(CH_3)_2 \)), 3.81 (2H, d, J = 7, CCH\(_2\)OH), 3.40 (2H, d, J = 6.5, CCH\(_2\)OH), 2.18 (1H, t, J = 6.5, OH), 1.71 (3H, s, CH\(_3\)), 1.64 (3H, s, CH\(_3\)), 1.17 (6H, s, 2 x CH\(_3\)); \(^{13}C\) NMR (100.6 MHz, CDCl\(_3\)) \( \delta \) 136.4, 121.9, 75.3, 69.6, 58.6, 26.0, 22.3, 18.2; m/z (CI, NH\(_4^+\)) 159 ([M+H]), 176 ([M+NH\(_4\)]).

In accordance with general procedure D, alcohol S-4 (2.0 g, 12.7 mmol) was oxidized to afford aldehyde 2b (1.8 g, 93%) as a colorless oil. \( R_f = 0.45 \) (10% EtOAc / hexanes); \( \nu_{max} \) / cm\(^{-1} \) (film) 2980 (s), 2933 (s), 2870 (s), 1736 (s), 1646 (w), 1450 (m); \(^1H\) NMR (400 MHz, CDCl\(_3\)) \( \delta \) 9.58 (1H, s, CH\(_O\)), 5.34 (1H, br. t, J = 7, CH=C(CH\(_3\)_2)), 3.90 (2H, d, J = 7, CCH\(_2\)OH), 1.74 (3H, s, CH\(_3\)), 1.65 (3H, s, CH\(_3\)), 1.28 (6H, s, 2 x CH\(_3\)); \(^{13}C\) NMR (100.6 MHz, CDCl\(_3\)) \( \delta \) 204.8, 137.7, 121.2, 80.1, 61.4, 26.1, 21.1, 18.2; m/z (CI, NH\(_4^+\)) 174 ([M+NH\(_4\)]).

Preparation of aldehyde 2g.
methyl 2,2-dimethoxy-5-methylhex-5-enoate (S-14)

Under a gentle flow of nitrogen, a round bottom flask was charged with tetrahydrofuran (30 mL), hexamethylphosphoramide (20 mL), and diisopropylamine (5.69 mL, 40.7 mmol). The mixture was cooled to -78 °C with stirring. To this solution, butyllithium (24 mL, 1.6 M in hexanes) was added dropwise. The reaction vessel was transferred to a 0 °C bath for 15 minutes. The solution was cooled to -78 °C and methyl dimethoxyacetate (4.55 mL, 37.0 mmol) was added to it dropwise. After stirring for 10 minutes at -78 °C, the reaction mixture was transferred to a 0 °C bath for 30 minutes. The solution was then cooled to -78 °C and 4-iodo-2-methylbut-1-ene (3.63 mL, 18.5 mmol) was added dropwise. The -78 °C bath was allowed to warm to 4 °C and the reaction mixture was stirred for an additional 12 hours. The reaction mixture was partitioned between 0.25M HCl (aq) (200 mL) and 1:1 diethyl ether / hexanes (200 mL). The organic layer was then washed with saturated aqueous sodium bicarbonate, water, and saturated sodium chloride (250 mL / ea). The organic layer was dried with sodium sulfate, filtered, and concentrated. Following purification via flash chromatography on silica gel (elute 5% Et2O / hex), title compound S-14 (1.66 g, 44%) was isolated as a colorless oil. \( R_f = 0.26 \) (20% EtOAc / hexanes); \( \nu_{\text{max}} \) / cm\(^{-1} \) (film) 2949 (w), 1758 (m), 1450 (w), 1101 (s); \(^1\)H NMR (500 MHz, CDCl\(_3\)) \( \delta \) 4.69 (1H, s, C=CH\(_3\)), 4.65 (1H, s, C=CH\(_3\)), 3.79 (3H, s, OCH\(_3\)), 3.52 (6H, s, 2 x OCH\(_3\)), 2.00 (2H, m, CH\(_2\)), 1.89 (2H, m, CH\(_2\)), 1.69 (3H, s, CH\(_3\)). \(^{13}\)C NMR (125.8 MHz, CDCl\(_3\)) \( \delta \) 169.8, 144.6, 110.3, 102.7, 52.7, 50.0, 32.0, 31.3, 22.8; \( m/z \) (ES+) 220 ([M+NH\(_4^+\)].

2,2-dimethoxy-5-methylhex-5-enal (2g)

Under a gentle flow of nitrogen, ester S-14 (1.60 g, 7.92 mmol) was dissolved in anhydrous dichloromethane (16 mL) and cooled to -78 °C while stirring. To this solution, diisobutylaluminum hydride (9.50 mL; 1 M in hexanes) was added dropwise to avoid exotherm. The reaction progress was monitored via GC and after 1 h methanol (5 mL) was added carefully to avoid exotherm. An aqueous solution of 10% Rochelle’s salt (10 mL) was immediately added in one portion and the reaction mixture diluted with diethyl ether (10 mL), removed from the cold bath, and allowed to warm to room temperature while stirring vigorously. The solution was filtered through celite, then partitioned between saturated aqueous sodium chloride and diethyl ether. The organic layer was dried with sodium sulfate. Following filtration and concentration, the title compound 2g was purified by flash chromatography, eluting with 2% to 5% Et\(_2\)O / hexanes, and isolated as a colorless oil (0.864 g, 64%). \( R_f = 0.64 \) (25% EtOAc / hexanes); \( \nu_{\text{max}} \) / cm\(^{-1} \) (film) 2943 (m), 1749 (s), 1450 (w), 1053 (s); \(^1\)H NMR (500 MHz, CDCl\(_3\)) \( \delta \) 9.44 (1H, s, CH\(_2\)), 4.70 (1H, s, C=CH\(_3\)), 4.66 (1H, s, C=CH\(_3\)), 3.27 (6H, s, 2 x OCH\(_3\)), 1.89 (4H, m, 2 x CH\(_2\)), 1.67 (3H, s, CH\(_3\)). \(^{13}\)C NMR (125.8 MHz, CDCl\(_3\)) \( \delta \) 200.2, 144.7, 110.7, 102.4, 49.8, 30.7, 30.2, 22.7; \( m/z \) (ApCI+) 141 ([M-OCH\(_3\)]), 100%; 173 ([M+H]), 20%.

**2,10-dimethyl-6-[(tetrahydro-2H-pyran-2-yl oxy)methyl]-undeca-2,9-dien-6-ol (S-18)**

To a stirred suspension of magnesium (85 mg, 24.3 mmol) in ether (5 mL) was added homoprenyl bromide 6 (60 \( \mu \)L, 0.23 mmol). The suspension was gently heated to initiate Grignard formation before adding additional homoprenyl bromide (600 \( \mu \)l, 2.25 mmol) at such a rate as to maintain auto reflux. After the initial exotherm subsided, the reaction mixture was diluted with ether (2 mL) and heated at reflux for 2 h. The solution was then cooled to –78 ºC and treated with methyl 2-(tetrahydro-2H-pyran-2-yl oxy)acetate (304 \( \mu \)L, 2 mmol) before warming to room temperature over 3 h. The reaction mixture was quenched with saturated aqueous NH\(_4\)Cl solution (20 mL), diluted with Et\(_2\)O (10 mL), and the organic phase separated. The aqueous phase was extracted with Et\(_2\)O (2 x 10 mL) and the combined organic extracts were washed with brine (20 mL). The organic phase was separated, dried (Na\(_2\)SO\(_4\)), and concentrated in vacuo to give the crude product. ![Structure of 4b]

Under a gentle flow of nitrogen, malonate S-21 (1.00 g, 3.09 mmol) was dissolved in anhydrous dichloromethane (5 mL) and cooled to -78 ºC while stirring. To this solution, diisobutylaluminum hydride (3.43 mL; 1 M in hexane) was added dropwise to avoid exotherm. The reaction progress was monitored via GC and after 1 h the mixture was quenched by careful addition of methanol (3 mL), avoiding exotherm. An aqueous solution of 10% Rochelle’s salt (10 mL) was immediately added in one portion and the reaction mixture was diluted with diethyl ether (5 mL) and allowed to warm to room temperature with vigorous stirring. The solution was filtered through celite, then partitioned between saturated aqueous sodium chloride and diethyl ether. The organic layer was dried with sodium sulfate, filtered, and concentrated. Although the crude product was determined 94% pure by GC, the title compound 4b was purified by flash chromatography, eluting with 2% Et₂O / hexanes, and isolated as a pale yellow oil (0.521 g, 60%).

2,8-dimethyl-5-((tetrahydro-2H-pyran-2-yloxy)methyl)nona-1,8-dien-5-ol (S-22)

![Structure of S-22]

To a stirred suspension of magnesium (8.51 g, 350 mmol) in diethyl ether (10 mL) was added 4-bromo-2-methylbut-1-ene⁷ (0.51 mL, 3.90 mmol) dropwise. The suspension was gently heated to initiate Grignard formation before adding additional 4-bromo-2-methylbut-1-ene (4.50 mL, 30.6 mmol) as a solution in diethyl ether (25 mL) at such a rate as to maintain auto reflux. After the initial exotherm subsided, the reaction mixture was heated at reflux for 2 h. The reaction was then cooled to -78 ºC and treated with methyl 2-(tetrahydro-2H-pyran-2-yloxy)acetate (2.0 g, 11.5 mmol) before warming to room temperature over 3 h. The reaction mixture was quenched with saturated aqueous NH₄Cl solution (200 mL), diluted with Et₂O (150 mL), and the organic phase separated. The aqueous phase was extracted with Et₂O (2 x 100 mL) and the combined organic extracts then washed with brine (200 mL). The organic phase was separated and dried (Na₂SO₄) before being concentrated to give the crude product. Purification by column chromatography eluting with 10% ether / hexane afforded tertiary alcohol S-22 (1.631 g, 50%) as

diol 8b

To a stirring mixture of 4Å molecular sieves (50 mg), toluene (63 µL), and catalyst 1c (49 mg, 0.05 mmol), contained in a flame dried 0.5 dram reaction vial, under a N₂ atmosphere, was added aldehyde 6b (98 mg, 0.5 mmol). The solution was allowed to stir at room temperature for 48 h, until starting material appeared consumed by TLC analysis. The reaction mixture was diluted with 50% Et₂O / hexanes (0.5 mL) and loaded onto a silica gel column. Purification via flash column chromatography, eluting with 25% Et₂O / hexanes, afforded diol 8b (45 mg, 46%) as a pale yellow oil in >30:1 dr by 1H-NMR and 92% ee by chiral GC (γ-TA, 140 ºC isothermal, t_r (major) 26.6 min, t_r (minor) 28.0 min.).
