**General Methods.** Solvents and starting materials were used as received. 3,6,9-Trioxadecan-1-ol (triethylene glycol monomethyl ether), 3,5-dinitrobenzoic acid and 3-nitrobenzoic acid are commercially available as bulk chemical and were used without further purification. Tetrahydrofuran (THF) was distilled under an inert gas (Ar) atmosphere from sodium/benzophenone prior to use for the reactions requiring absolute THF. The chiral side chain (2S)-4,7,10,13-tetraoxatetradecan-2-ol\([1]\) AA’ monomer 6-ethynyl-2-[(triisopropylsilyl)ethynyl]-4-(3,6,9-trioxadec-1-yloxy)pyridine 1,\([2]\) and esterification catalyst 4-dimethylaminopyridinium p-toluenesulfonate (DPTS)\([3]\) were prepared using previously published procedures. Pd(PPh\(_3\))\(_4\) was freshly prepared.\([4]\) All reactions requiring inert gas were performed under Ar atmosphere. The Cu-catalyzed cycloaddition reactions were performed in the dark under argon atmosphere, solid sodium ascorbate and concentrated aqueous CuSO\(_4\) stock solutions (10 mg CuSO\(_4\)/0.3 mL of H\(_2\)O) were used as in-situ Cu(I)-source. An aqueous EDTA-disodium salt solution (16 g/L Na\(_2\)-EDTA), adjusted to a pH ~ 8-9, was used to remove Cu-ions in aqueous extraction steps. Column chromatography was carried out with 130 – 400 mesh silica gel using the eluents specified (PE = petroleum ether, EtOAc = ethyl acetate). NMR spectra were recorded on a 300 MHz (75.6 MHz for 13C) Bruker DPX 300 spectrometer or a 300 MHz Bruker Avance II spectrometer at 23 °C using residual protonated solvent signals as internal standard (\(^1\)H: \(\delta(CHCl_3) = 7.26\) ppm and \(^{13}\)C: \(\delta(CHCl_3) = 77.11\) ppm). Assignments are based on chemical shifts (Ar is used as abbreviation for assigning both aromatic as well as triazole moieties). Mass spectrometry was performed on Thermo LTQ FT instrument (ESI, ESI-HRMS; additives of mixtures of MeOH/H\(_2\)O 75/25 + 0.5 % formic acid) and MSI Concept 1H (EI, 70 eV ionization) as well as on a QSTARXL Applied Biosystems ESI Q-TOF with a ISV of 950 V. HPLC separations were performed with Shimadzu LC-10A systems equipped with a photodiode array detector (PAD or DAD; mixtures of water/MeOH as eluent) or with Waters Alliance systems (mixtures and gradient mixtures of acetonitrile/water) equipped with 150 x 2 mm Luna columns (3 \(\mu\)m, phenyl-hexyl material). The Waters systems consisted of a Waters Separations Module 2695, a Waters Diode Array detector 996 and a Waters Mass Detector ZQ 2000. Conditions are specified when describing the corresponding substances. Signals have been detected by UV between 200-400 nm

GPC measurements were performed on a WGE Dr. Bures system equipped with three 300 x 8 mm SDV columns (50 Å 5 μ PSS, 500 Å 5 μ PSS, 1000 Å 5 μ PSS) and one 50 x 8 mm SDV column using both UV (300 nm) and RI detection. The measurements were performed in THF at 30 °C using a flow rate of 1 mL/min. The columns were calibrated with several narrow polydispersity polystyrene samples.

UV-visible absorption and fluorescence emission spectra were recorded in quartz cuvettes of 1 cm path length on a Cary 50 Spectrophotometer and a Cary Eclipse Fluorimeter, respectively, each equipped with a Peltier thermostated cell holder at 25 ± 0.05 °C using spectrophotometric grade solvents. Emission spectra were corrected for variations in photomultiplier response and lamp intensity over wavelength using correction curves generated on the instrument, followed by normalization considering the optical density of the sample at the excitation wavelength. The samples were excited at λ = 265 nm, slit widths were set to 10 nm bandpass for excitation and 10 nm bandpass for emission. Optical response experiments of oligomer 10 towards halide anions were performed in solvent mixtures of 75 vol% water in acetonitrile at 25 °C and a halide anion concentration of 7.5 · 10⁻² M. Note that due to the low concentrations, necessary to avoid aggregation and for analytical reasons (CD spectroscopy), large excess of halide anions had to be employed to achieve binding and therefore titration experiments to deduce binding stoichiometry were not possible. Circular dichroism spectra were recorded on a JASCO J-710 spectropolarimeter using quartz cuvettes of 1cm path length at 25 ± 1 °C. In some cases circular dichroism spectra recorded as θ in millidegrees, were converted in Δε using the equation Δε = 0/32980 · c · 1 , where Δε is the molar circular-dichroid absorption in M⁻¹ cm⁻¹, c is the concentration in mol/L, and L is the path length of the cuvette (= 1 cm). Temperature dependent CD measurements were performed over a temperature range starting at 5 °C up to 75 °C by heating the sample in temperature intervals of 10 K, allowing the sample to equilibrate for 40 min at each temperature (until the CD signal intensity remained constant). The influence of 18-crown-6 on the folding behavior of oligomer 10 in the presence of potassium halides was analyzed by using an aqueous 0.22 M 18-crown-6 solution, which was mixed with an aqueous 0.20 M KBr solution, stirred at rt for 30 min, and after addition of an acetonitrile solution containing oligomer 10 CD spectra were recorded in an overall 75 vol% water in acetonitrile solution. The molecular model of heptadecamer 10 (MS Figure 1) was generated via semiempirical PM3 geometry optimization of a “rational” model, which was constructed from DFT-optimized BTP segments joined in a reasonable geometry. Note that due to the projected exhausting calculation times appropriate higher level calculations have not been attended.
Synthesis. The preparation and characterization of the compounds outlined in Scheme 1 of the manuscript are provided below:

**Synthesis of the chiral diazido benzoate building block**

![Chemical structure](image)

(2S)-4,7,10,13-tetraoxatetradecan-2-yl 3,5-dinitrobenzoate 11

In a two-necked flask 18.01 g 3,5-dinitrobenzoic acid (84.9 mmol, 1.15 equiv.) and 16.4 g (2S)-4,7,10,13-tetraoxatetradecan-2-ol (73.8 mmol, 1 equiv.) were dissolved in 50 mL of dry THF at rt and after cooling the mixture down to 0 °C under argon atmosphere a mixture of 5.44 g DPTS (18.5 mmol, 0.25 equiv.) dissolved in CH₂Cl₂ was added. 13.8 mL of N,N'-diisopropylcarbodiimide (88.6 mmol, 1.2 equiv.) were added drop wise in the counterflow of argon using a syringe whereupon a colorless precipitate appeared immediately and the mixture became viscous. After 10 min the mixture was allowed to reach rt and stirred over night at rt under argon. After consumption of all starting material indicated by TLC monitoring the reaction was quenched with 100 mL of water and stirred for ½ h. The solvent was removed in vacuo and the residue was dried in oil pump vacuo for 1 h, toluene added and the colorless solid was filtered off. After standing in the fridge for 4 h the mixture was filtered again, the solvent removed in vacuo and the title compound was isolated as pale yellow oil using column chromatography (PE/EtOAc 7/3 → EtOAc) in 85-95% yield. **TLC** (PE/EtOAc 2/8) Rₜ = 0.44. **¹H-NMR** (300 MHz, CDCl₃): δ (ppm) = 9.18 (t, J₄ = 2.1 Hz, 1H, Ar-H), 9.12 (d, J₄ = 2.1 Hz, 2H, Ar-H), 5.46 – 5.36 (m, 1H, CHCH₃), 3.76 – 3.55 (m, 12H, OC₃H₂), 3.51 – 3.47 (m, 2H, OC₃H₂), 3.32 (s, 3H, OC₃H₃), 1.40 (d, J₃ = 6.6 Hz, 3H, CHCH₃). **¹³C-NMR** (75 MHz, CDCl₃): δ (ppm) = 162.03 (-CO₂-), 148.57 (NO₂Cₐr), 134.26 (Cₐr), 129.47 (CHₐr), 122.24 (CHₐr), 73.36 (OCH₂), 72.46 (CHCH₃), 71.85 (OCH₂), 70.74 (OCH₂), 70.56 (OCH₂), 70.54 (OCH₂), 70.45 (OCH₂), 58.95 (OCH₃), 16.54 (CHCH₃). **MS** (ESI): m/z = 417.1 ([M + H]⁺), 434.1 ([M + NH₄]⁺), 439.1 ([M + Na]⁺), 455.1 ([M + K]⁺). **HRMS** (ESI): m/z = 439.1324 (calcd 439.1323 for [M + Na]⁺). **HPLC** (CH₃CN/H₂O 4/6 → 95/5, tᵣ = 11.3 min.): 99.9 area %.
(2S)-4,7,10,13-tetraoxatetradecan-2-yl 3,5-diaminobenzoate 12

1.053 g (2.53 mmol, 1 equiv.) 11 were treated with 0.11 g Pd on activated carbon (10% wt) in 10 mL of ethyl acetate and the mixture was evacuated and flushed with H₂ repeatedly (3 cycles) and afterwards stirred under H₂ atmosphere (2 bar) for 6 h to give 898 mg of the title compound as a brown oil (quantitative yield). TLC (CH₂Cl₂/acetone 8/2 + 0.1 % TEA) Rf = 0.12. 

**1H-NMR** (300 MHz, CDCl₃): δ (ppm) = 6.80 (d, J₂ = 2.1 Hz, 2H, ArH), 6.21 (t, J₂ = 2.0 Hz, 1H, ArH), 5.31 - 5.21 (m, 1H, CHCH₃), 3.73 - 3.51 (m, 14H, OC₃H₂), 3.37 (s, 3H, OC₃H₃), 1.33 (d, J₃ = 6.5 Hz, 3H, CHC₃).

**13C-NMR** (75 MHz, CDCl₃): δ (ppm) = 166.36 (-CO₂-), 147.21 (NH₂C₆H₅), 132.50 (CO₂C₆H₅), 107.38 (H₅C₆H₅), 105.97 (HC₆H₅), 73.83 (OCH₂), 71.99 (OCH₂), 70.93 (CHCH₃), 70.74 (OCH₂), 70.68 (OCH₂), 70.57 (OCH₂), 69.94 (OCH₂), 59.11 (OCH₃), 16.81 (CHC₃).

**HPLC** (CH₃CN/H₂O 4/6 → 95/5, tR = 2.6 min.): 99.9 area %.

(2S)-4,7,10,13-tetraoxatetradecan-2-yl 3,5-diazidobenzoate 2

0.906 g (2.543 mmol, 1 equiv.) were dissolved in 50 ml of 37 % HCl, cooled down to 0 °C and treated successively with small portions of 0.597 g NaNO₂ (8.646 mmol, 3.4 equiv.) and after stirring for 20 min at 0 °C 0.562 g NaN₃ (8.646 mmol, 3.4 equiv.) were added gradually. Stirring was continued for 15 min. at 0 °C and afterwards the mixture was allowed to reach rt and after stirring at rt for 20 min it was poured into 150 mL of ice cold water, transferred into a separation funnel and the aqueous phase was extracted with ethyl acetate (4 x). The combined organic phases were washed with water (1 x), sat. NaHCO₃ solution (1 x) and aqueous sat. NaCl solution. After drying over MgSO₄ the solvent was removed in vacuo. 0.78 g of the title compound were obtained as an orange oil after purification by column chromatography (gradient of CH₂Cl₂/MeOH 96/4 → 94/6) (yields ranging from 75-90%). TLC (CH₂Cl₂/acetone 8/2) Rf = 0.42. 

**1H-NMR** (300 MHz, CDCl₃): δ (ppm) = 7.47 (d, J₂ = 2.1 Hz, 2H, ArH), 6.8 (t, J₂ = 2.1 Hz, 1H, ArH), 5.33 -5.31 (m, 1H, CHCH₃), 3.76 - 3.53 (m, 14H, OC₃H₂), 3.37 (s, 3H, OC₃H₃), 1.37 (d, J₃ = 6.4 Hz, 3H, CHC₃).

**13C-NMR** (75 MHz, CDCl₃): δ (ppm) = 164.10 (-CO₂), 141.87 (N₃C₆H₅), 133.46 (CO₂C₆H₅), 116.10 (HC₆H₅), 113.42 (HC₆H₅), 73.31 (OCH₂), 71.67 (OCH₂), 70.80 (CHCH₃), 70.59 (OCH₂), 70.37 (OCH₂), 70.26 (OCH₂), 58.74 (OCH₃), 16.51 (CHCH₃). HRMS (ESI): m/z = 431.1649 (calcd 431.1644 for [M + Na]+). HPLC (125 mm

\textit{General procedure of the copper catalyzed 1,3-dipolar cycloaddition}

In a three necked flask the bisacetylene component (1 equiv.), the aryl azide component (if not noted: 2.4 equiv. per mol bisacetylene) were dissolved in CH$_2$Cl$_2$ and the solvent mixture of H$_2$O/tertBuOH (1/2) was added. Sodium ascorbate (0.4 equiv.) and TBTA (0.15 equiv.) were added. The flask was evacuated and flushed with argon repeatedly (3 cycles). CuSO$_4$ (0.15 equiv., stock solution, 10 mg CuSO$_4$ per 0.3 mL of water) was added in the counterflow of argon and the mixture was vigorously stirred at rt in the dark for the period of time as noted. In case of an appearing precipitate additional CH$_2$Cl$_2$ was added. The reaction course was monitored by taking small samples for HPLC or GPC analysis and in case of a sluggish getting reaction rate additional sodium ascorbate (0.4 equiv.) was added. After the acetylene starting material was consumed the mixture was diluted with CH$_2$Cl$_2$ and transferred into a separation funnel. The organic phase was washed with aqueous Na$_2$-EDTA solution (1 x), the aqueous phase was extracted with CH$_2$Cl$_2$ (3 x), and afterwards the combined organic phases were washed again with aqueous Na$_2$-EDTA solution (2 x) and once with aqueous sat. NaCl solution. After drying over MgSO$_4$, filtration, and removal of the solvent \textit{in vacuo} the corresponding products were isolated by column chromatography (CH$_2$Cl$_2$/acetone or CH$_2$Cl$_2$/MeOH).
3-Azido-5-{4-[4-(3,6,9-trioxadec-1-yloxy)]-6-[(triisopropylsilanyl)-ethynyl]-pyridin-2-yl-[1,2,3]-triazole-1-yl}-benzoic acid (2S)-4,7,10,13-tetraoxatetradecan-2-yl ester

The reaction was performed with 1 (1 equiv.) and 2 (1 equiv.) following the general “Click reaction” protocol using the amount of 5 mol% CuSO₄, 5 mol% TBTA and 20 mol% sodium ascorbate under argon atmosphere and the reaction was stirred for 4 d. Products have been isolated using column chromatography (gradient CH₂Cl₂ → CH₂Cl₂/acetone 8/2) to give the title compound as yellow oil (26-35%). TLC (CH₂Cl₂/acetone 85/15) Rf = 0.6. ¹H-NMR (300 MHz, CDCl₃): δ (ppm) = 8.76 (s, 1H, ArH), 8.16 (t, J₄ = 1.6 Hz, 1H, ArH), 7.74 (t, J₄ = 1.8 Hz, 3H, ArH), 7.0 (d, J₄ = 2.4 Hz, 1H, ArH), 5.42 – 5.32 (m, 1H, CΗCH₃), 4.28 (t, J₃ = 4.8 Hz, 2H, OCH₂), 3.89 (t, J₃ = 4.9 Hz, 2H, OCH₂), 3.75 – 3.47 (m, 22H, OCH₂), 3.35 (s, 3H, OCH₃), 3.32 (s, 3H, OCH₃), 1.38 (d, J₃ = 6.5 Hz, 3H, CHC(CH₃)₃), 1.14, 1.13 (s, s, 21H, SiCHCH₃). ¹³C-NMR (75 MHz, CDCl₃): δ (ppm) = 165.62 (-C=O₂-), 163.93 (-CO₂-), 151.29 (Cₐr), 148.73 (Cₐr), 144.18 (Cₐr), 142.50 (Cₐr), 138.13 (Cₐr), 133.93 (Cₐr), 120.95 (Cₐr), 119.96 (Cₐr), 117.07 (Cₐr), 115.03 (Cₐr), 114.96 (Cₐr), 105.84 (Cₐr), 105.72 (C≡C), 91.57 (C≡C), 73.53 (OCH₂), 71.91 (OCH₂), 71.88 (OCH₂), 71.38 (OCH₂), 71.31 (OCH₂), 70.92 (OCH₂), 70.77 (OCH₂), 70.62 (OCH₂), 70.60 (CHCH₃), 70.56 (OCH₂), 70.44 (OCH₂), 69.24 (OCH₂), 67.81 (OCH₂), 58.99 (OCH₃), 58.93 (OCH₃), 18.66 (Si-CH-CH₃), 16.69 (CHCH₃), 11.26 (Si-CH).
